Event Technology Awards: AI Edition

➔ **Baran, Eventpack, Kerem** NK3MKIFKXQTGW6Q

🏆 **Best AI for Registration & Onboarding**
For AI systems that speed up or simplify registration, check-in, and onboarding. Judges will assess improvements in queue times, user experience, and data accuracy.

COMPANY INFORMATION

Company / Organisation Name
Eventpack

Product Name (optional)
AI Registration Approval

Company profile
Eventpack is an on-site event management platform founded by Serhat Sarikavak and Kerem Baran, the team behind Boomset, one of the industry's most established on-site event technology companies. Boomset was acquired by Hopin in 2021, and Eventpack was launched to carry that expertise forward under a new, independent venture.

The platform covers the full on-site event stack: registration and ticketing, self-service kiosks, badge printing, session management, lead capture, exhibitor tools, and mobile event apps. It is built for event organizers, agencies, associations, universities, and B2B teams who need a complete and reliable operations platform without the complexity or cost of enterprise alternatives.

Eventpack differentiates through zero ticketing fees, modular pricing, offline capabilities, and fast setup. It serves customers across the US and Europe and is used at events ranging from association conferences to large-scale trade shows.
The company is headquartered in the US and operates with a lean, experienced team of nine people.

Questions / Answers

YOUR PRODUCT

Description of your technology
AI Registration Approval is a new feature within Eventpack's registration module. It adds an AI-assisted screening layer to any ticket type that requires organizer approval before registration is confirmed. Common use cases include press passes, startup discounts, hosted buyer programs, VIP access, and exhibitor spots.

Setting up an approval workflow takes minutes. Organizers enable approval on any ticket type, select which form fields are relevant to the screening process, and write their criteria in plain language. No technical configuration, no scoring rubrics to build, no external tools to connect. The criteria prompt works like a brief to a smart colleague: describe who should be approved and what to check, and the AI handles the rest.

From the applicant's side, the experience is straightforward. They fill out the registration form as normal, with the addition of any approval-specific fields the organizer requires. After submitting, they receive a confirmation message letting them know their application is under review. Once a decision is made, they are notified by email.

On the organizer's side, every incoming application is automatically analyzed by AI and presented in a dedicated Approval Requests dashboard. Each entry shows the applicant's AI score and status at a glance. Organizers can open any application to see the full submitted data alongside the AI's written analysis, then approve, reject, or reassign the applicant to a different ticket type with a single click.

For events with high application volumes, organizers can configure an automatic approval threshold. Applications that score above the threshold are approved instantly without manual review, while lower-scoring applications remain in the queue for human judgment.

TECHNOLOGY DESCRIPTION

Explain how the AI works in your solution?
Eventpack's AI Registration Approval is powered by a large language model (Claude or GPT, organizer's choice). When an applicant submits a registration request, the AI receives two inputs: the applicant's submitted form data and the organizer's freeform screening criteria.

The AI actively visits any URLs submitted by the applicant, such as LinkedIn profiles or company websites, and verifies that the content matches the applicant's claims. If an applicant submits a LinkedIn profile that does not correspond to their stated identity, the AI flags the inconsistency.

Against the organizer's criteria, the AI produces three outputs: a percentage score reflecting how well the applicant matches the defined profile, a tiered suggestion (Approve, Needs Review, or Reject), and a written explanation of its reasoning in plain language.

The organizer reads the AI's analysis alongside the applicant's submitted data and makes the final decision. For high-confidence cases, organizers can configure an automatic approval threshold, allowing the AI to approve applicants who score above a set percentage without manual review.

Questions / Answers

What specific problem does this AI solve?
Event organizers managing gated ticket types face different challenges depending on the nature of their event.

For large-scale conferences, the volume of applications for discounted or restricted ticket types, such as startup passes or academic discounts, can run into the hundreds. Reviewing each application manually is either impractical or requires hiring additional staff solely for the validation process. Quality also suffers at scale: reviewers get fatigued, criteria get applied inconsistently, and some applicants slip through who should not.

For more boutique programs such as hosted buyer or VIP access, the problem is depth rather than volume. Each application requires multiple checks: verifying professional credentials, confirming company details, cross-referencing LinkedIn profiles, and assessing whether the applicant genuinely fits the profile. This is time-consuming even for a small number of applicants, and the stakes of getting it wrong are higher.

In both cases, organizers are currently handling this manually with no purpose-built tooling. AI Registration Approval addresses both scenarios: it handles volume by processing every application instantly and consistently, and it handles depth by actively visiting submitted URLs, verifying identity signals, and producing a detailed written analysis for each applicant. Organizers spend their time making decisions, not doing research.

What makes your approach different or innovative?
Approval workflows for gated registrations are not new, but the tooling for them has not kept pace. Organizers have largely been managing this process manually, switching between tabs, cross-checking profiles, and applying criteria inconsistently across reviewers.

AI Registration Approval addresses this by automating the verification step, not just the data collection. The AI actively visits submitted URLs such as LinkedIn profiles and company websites, and checks whether the content matches the applicant's claims, rather than taking submitted information at face value.

Organizers write their criteria in plain language, the same way they would describe the ideal applicant to a colleague. There is no technical configuration, no scoring rubrics to build, and no external tools to connect. Setup takes minutes. The AI applies the criteria consistently across every application regardless of volume, removing the variability that comes with manual review.

The system also tracks its own accuracy against the organizer's manual decisions over time, giving organizers a measurable basis for deciding when to switch to automated approvals or rejections. Both thresholds are fully configurable.

VALIDATION

Questions / Answers

How did you test, validate, or quality-check the AI outputs to ensure they were accurate, safe, or reliable?
AI Registration Approval is currently in its pre-launch stage. Our validation approach has been built around real event planners and real data from the start.

We engaged with event organizers across multiple event types, including large-scale conferences, hosted buyer programs, and association events, throughout the design and development process. Rather than building the feature in isolation and testing it afterwards, we shaped the feature around their workflows, their pain points, and their specific approval criteria. Their input directly informed decisions such as the three-tier scoring system, the plain language criteria setup, and the auto-approval threshold configuration.

For simulation testing, we worked with event planners who currently manage approval processes manually. They submitted real applicant data from previous events, which we used to run the AI against known outcomes. This allowed us to compare the AI's suggestions against decisions that had already been made by experienced humans, giving us a meaningful baseline for accuracy.

On the organizer side, the system is designed so that quality control does not end at launch. Before publishing an approval workflow, organizers can test their criteria against sample submissions and see how the AI responds. They can adjust the criteria and re-test until they are confident in the output. This is intentional: organizers know their audience better than any generic model, and the tool is built to reflect that.

The self-calibrating accuracy tracking feature, where the system monitors its own prediction rate against manual decisions over time, also serves as an ongoing validation mechanism built into the product itself.

IMPACT
In one summary, explain the overall impact of your AI solution. Please cover four areas: innovation, execution, user or customer outcomes, and measurable results.

Innovation
AI Registration Approval brings genuine automation to a part of the event workflow that has never had it. Approval processes for gated ticket types have always existed, but the act of vetting each applicant has remained entirely manual, with no purpose-built tooling to support it.

The feature introduces active verification rather than passive data collection. The AI visits submitted URLs and cross-checks them against the applicant's claims, something no human reviewer can do at scale without significant time investment. Combined with plain language criteria setup, a self-calibrating accuracy model, and fully configurable automation thresholds, it represents a meaningful shift in how organizers manage access to their events.

Questions / Answers

Execution
The feature was designed in close collaboration with event organizers across different event types, including large conferences, hosted buyer programs, and association events. Their workflows, criteria, and pain points shaped every product decision, from the three-tier scoring system to the plain language criteria input.

Simulation testing was conducted using real applicant data from previous events, provided by organizers who currently manage this process manually. This allowed us to benchmark AI suggestions against known human decisions before launch.

The organizer-side testing capability, where criteria can be validated against sample data before going live, was built deliberately so that quality control remains in the hands of the people who know their audience best.

Outcome
For organizers, the expected outcome is a significant reduction in the time spent on applicant screening, particularly for events with high application volumes or programs that require deep credential checks. Decisions that previously required individual research for each applicant are replaced by a reviewed AI analysis, with the organizer making the final call.

The consistency of AI-applied criteria also addresses a common problem in manual review: different reviewers applying the same criteria differently, leading to uneven decisions across an applicant pool.

Results
As a pre-launch feature, we do not yet have live deployment data to share. We are currently working with early adopter customers across different event types and will have measurable results, including time saved per application and approval accuracy rates, available following initial deployments.

CASE STUDY

Describe how the AI was used in practice.
Event Tech Live is one of the leading event technology conferences in the world, run by Adam Parry and his team. ETL currently uses Eventpack's manual approval workflow to manage screenings for three distinct ticket types: Hosted Buyer, Speaker, and Press. Each requires a different set of criteria and a different level of scrutiny.

As part of an expanded collaboration for Event Tech Live 2026, we are working closely with Adam and his team to build AI Registration Approval, well ahead of their event launch. ETL's three screening programs, each with different standards and levels of complexity, are directly informing how the feature handles varied approval workflows in practice.

The goal is to give ETL the same level of control and judgment they currently apply manually, at a scale and speed that is not possible with a human-only process, and to build a tool that serves this need across the wider event industry.

What measurable results or improvements did it deliver?
(Include any evidence that shows real-world impact.)

AI Registration Approval has not yet been deployed at a live event, so post-event metrics are not available at this stage. Measurable data will be available following initial deployments later this year.

Questions / Answers

MODEL TRANSPARENCY (optional)

What type of AI model or technique does your solution use? Please provide a simple, high-level explanation that helps judges understand the approach (no confidential or proprietary details required).

AI Registration Approval is built on large language models (LLMs), specifically Claude by Anthropic and GPT by OpenAI, with organizers able to choose their preferred model. LLMs are used for their ability to interpret freeform natural language instructions, reason across multiple data points, and produce structured outputs alongside plain language explanations. No proprietary or custom model is involved.

Criteria	Score
Innovation * How original and forward-thinking is the approach? Whether you built an AI solution, adopted AI within your own events operation, or are bringing an early-stage concept to market, judges want to see genuine originality. Has AI been applied in a new or distinctive way? Does it solve a real problem creatively rather than following the obvious path? Look beyond off-the-shelf deployment and assess the quality of thinking behind the approach.	/ 100
Impact * What difference has this made, or what difference is it credibly expected to make? For live solutions, look for concrete evidence -- engagement rates, time saved, revenue generated, cost reduction, satisfaction scores. For pilot or beta-stage entries, early indicators such as user testing results, pilot outcomes, letters of intent, or projected impact grounded in credible data are all valid. Strong entries will be specific, not vague.	/ 100

Recuse yourself if you have a professional or personal conflict of interest

Scoring is incomplete ⚠

Criteria	Score
Execution * How well has this been implemented or developed? For suppliers and vendors, consider the quality of the build, the robustness of delivery, and how challenges were handled. For organisers, consider how well AI was embedded into operations and how the team managed change. For early-stage entries, assess the quality of the product so far, the clarity of the roadmap, and the credibility of the team's approach. Thoughtful, professional execution at any stage counts highly.	/ 100
Results * What has been achieved, and what does the evidence show? For established solutions, consider client outcomes, retention, testimonials, and industry recognition alongside hard metrics. For organisers, attendee feedback, operational improvements, and stakeholder satisfaction all count. For startups or beta entries, judges should look for credible progress -- pilot conversions, early user feedback, investment secured, or strategic partnerships -- and should assess potential alongside proven outcomes. Do not penalise entries for being early stage; reward evidence of meaningful progress and a clear path to impact.	/ 100
