Event Technology Awards: AI Edition

➔ **Seifert, eBrain Technology Group GmbH, Linnea** RCB02L6F0AE2Z8G

🏆 **Best AI for Registration & Onboarding**
For AI systems that speed up or simplify registration, check-in, and onboarding. Judges will assess improvements in queue times, user experience, and data accuracy.

Questions / Answers

Company profile

eBrain Technology Group builds the first AI-centric operating model for attendee management and live communication. The company unites what rarely comes together in this industry: over two decades of international event excellence, deep AI and strategy expertise, and a dedicated full-stack and AI engineering team.

The foundation was an attendee management system successfully deployed since 2004, operationally validated across industries and event formats. Rather than cosmetically updating this system, the team chose a radical rebuild: the entire attendee journey - from personalized registration and intelligent communication through real-time logistics orchestration and frictionless check-in to a personalized mobile event experience and post-event analytics - was reconceived as an AI-centric, synchronized workflow architecture.

eBrain operates on EU-sovereign cloud infrastructure (IONOS), is GDPR-compliant by design and addresses the requirements of the EU AI Act. The team comprises event industry veterans, AI strategists, academically grounded specialists, and experienced developers.

Headquartered in Berlin, eBrain serves event agencies and enterprises that want to move beyond digitizing attendee management toward intelligently orchestrating it - eliminating queue times, maximizing data accuracy, and delivering hyperpersonalized user experiences across every attendee touchpoint.

YOUR PRODUCT

Questions / Answers

Description of your technology

eBrain is not an attendee management tool with AI features. eBrain is an AI-centric operating model that redefines the entire logic of how attendees are registered, managed, communicated with, checked in, and personally guided through their event experience.

The event industry has digitized attendee management - but it has not made it intelligent. Behind every successful event lies an invisible layer of rigid registration forms, fragmented participant data, manual change cascades, disconnected check-in systems, and generic mass communication. Attendee management teams spend the majority of their working hours not on guest experience, but on data reconciliation and coordination overhead. eBrain was built to solve this structural problem.

Five-layer architecture for attendee management excellence:
eBrain organizes the complete attendee journey across five interconnected layers: The Experience Layer delivers AI-generated event websites, intelligent registration with shopping cart, add-ons, group logic, flexible ticketing, QR-based check-in, and a personalized mobile app that extends the attendee experience from screen to venue - with individualized agendas, real-time updates, and contextual event information. The Operations Layer manages participant data, hotel contingents, session assignments, transfer logistics, catering preferences, surveys, and change management - all synchronized in real time. The Intelligence Layer embeds AI into every attendee touchpoint: registration optimization, hyperpersonalized communication by participant type, real-time contingent steering, and Emily as the dialogic access and action layer - powered by an agentic architecture where the LLM reasons, selects tools, and chains actions autonomously. The Synchronization Layer serves as the single source of truth, keeping attendee data, statuses, and contingent allocations consistent across all touchpoints - eliminating the manual reconciliation cascades that cause data inaccuracies. The Trust & Compliance Layer ensures EU-sovereign hosting, GDPR compliance, and EU AI Act readiness — critical for handling sensitive attendee data.

Four core engines across the attendee lifecycle:
The Setup Machine enables AI-powered event website creation via wizard and prompting, registration configuration with conditional logic, ticketing setup, and campaign launch. The Run Machine delivers real-time attendee monitoring, automated and personalized communication workflows, synchronized change management, and live contingent steering for hotels, sessions, shuttles, and catering. The Onsite Machine handles branded badge generation with QR codes, sub-30-second check-in, and live attendance status - eliminating queues and manual lists. The Learn Machine captures registration funnel analytics, check-in throughput metrics, NLP-processed attendee feedback, and historical benchmarks for continuous improvement.

Emily - the attendee management intelligence layer:
Emily is not a chatbot feature. Emily is a dialogic access, guidance, and action layer for the entire attendee management operation. Event managers ask natural-language questions (“How many VIPs have completed registration?”, “Which hotel contingent is overbooked?”), receive immediate answers with action recommendations, and can trigger actions directly - such as sending a personalized reminder to incomplete sign-ups. Emily makes even less experienced team members immediately effective and dramatically reduces staff onboarding time.

The result: an attendee management experience where participants move from personalized invitation through intuitive registration and mobile event companion to frictionless badge scan - and event teams move from data chaos to intelligent orchestration.

TECHNOLOGY DESCRIPTION

Questions / Answers

Explain how the AI works in your solution?
AI operates in eBrain's attendee management stack across three clearly differentiated levels - not as a single feature, but as a continuous intelligence layer spanning the entire attendee journey from registration to post-event learning.

LLM level: High-performance language models generate event website and registration page content, optimize communication copy, process natural-language queries about attendee status, and deliver contextual assistance. A corporate design crawler automatically extracts brand identity to ensure every attendee touchpoint matches the client's visual identity.

Assistant level: Specialized AI assistants guide users through registration setup, personalized attendee communication, contingent management, and check-in configuration. They deliver contextual guidance and action recommendations adapted to the current event status and user role

Agent level: Task-oriented AI agents handle concrete attendee operations - the CTA agent flags incomplete registrations and overbooked contingents, while other agents manage confirmation workflows, data reconciliation, and cross-touchpoint status updates when attendees modify their bookings.

Emily unifies all three levels as the dialogic interface: teams interact through natural language, receiving real-time answers about registration status, contingent availability, and attendee data - without context switches. The entire AI infrastructure runs on EU-sovereign cloud (IONOS), is GDPR-compliant by design, and addresses EU AI Act requirements.

What specific problem does this AI solve?
Event attendee management does not have a digitization problem. It has an intelligence problem.

Existing tools have moved registration online - but they have not made the attendee journey intelligent. They replicate rigid, form-based workflows on a digital surface: disconnected data silos between registration, communication, logistics, and check-in. Generic mass emails instead of personalized attendee communication. No real-time contingent visibility. Check-in systems that create queues instead of eliminating them. No connected mobile experience that extends personalization to the venue. The result is legacy thinking running on modern infrastructure - consuming capacity without improving the attendee experience or data quality.

A single attendee change - a cancellation, a room switch, a dietary update - triggers manual follow-up across five or more touchpoints: update the participant list, notify the hotel, adjust the shuttle plan, correct the badge, revise the catering count, adapt the confirmation. These cascades cost time, produce data inconsistencies, and degrade user experience.

eBrain solves this by rebuilding the entire attendee management logic as AI-centric - synchronized, dialogic, personalized, and designed for zero-friction attendee journeys from first invitation to post-event feedback.

Questions / Answers

What makes your approach different or innovative?
The fundamental difference: eBrain did not bolt AI onto an existing attendee management system. eBrain rebuilt the operating model itself as AI-centric from the ground up.

First: End-to-end attendee intelligence, not point solutions. While others add a chatbot to a legacy form builder, eBrain embeds AI across the entire attendee journey: from website creation through registration, personalized communication, logistics orchestration, check-in, mobile event experience, and post-event learning. Every touchpoint becomes more intelligent, not just one.

Second: Dialogic attendee management replaces static admin panels. Emily transforms how teams interact with attendee data. Instead of navigating spreadsheets and filter views, teams ask natural-language questions and receive instant answers with action triggers.

Third: Synchronized truth eliminates data inaccuracy. The Synchronization Layer ensures every attendee change takes effect system-wide instantly: across contingents, badges, catering, shuttles, mobile app content, and communications. No manual reconciliation, no stale data.

Fourth: Proven attendee management foundation, not startup speculation. eBrain builds on 20+ years of real event process logic - validated across international events. The innovation is the paradigm shift: from attendee administration to attendee intelligence.

VALIDATION

Questions / Answers

How did you test, validate, or quality-check the AI outputs to ensure they were accurate, safe, or reliable?
eBrain's validation strategy for attendee management follows one principle: data accuracy and user experience before technological ambition. Every AI application is measured against real operational outcomes - queue times, data consistency, and attendee satisfaction.

1. Foundation from 20+ years of attendee management validation
The underlying attendee management logic is not theoretical - it has been tested in real event projects across industries and complexity levels for over two decades. This operational experience defines where AI creates genuine leverage in the attendee journey and where human control remains essential. eBrain was not built from technology enthusiasm, but from deep understanding of real attendee management bottlenecks: form abandonment, data inconsistencies, check-in delays, communication fragmentation, and onboarding friction.

2. Surgical AI integration by attendee management use case
Rather than deploying AI generically, the most critical bottlenecks were analyzed individually: registration page creation, data validation, change synchronization, personalized communication, contingent management, badge generation, check-in throughput, and mobile experience delivery. For each use case, the team defined which AI intervention serves a clear purpose and which quality parameters apply. This surgical approach ensures AI is only deployed where it measurably improves speed, data accuracy, or user experience.

3. Three-level quality assurance for attendee data
At the LLM level, generated content - registration pages, confirmation messages, event website copy - is constrained by contextual parameters and brand logic. The corporate design crawler ensures visual consistency across all attendee-facing touchpoints. At the assistant level, recommendations are bound to actual attendee data - assistants work on real participant, contingent, and status information, not hallucinated data. At the agent level, triggered actions such as sending confirmations or updating contingents are presented as suggestions - final approval remains with the human operator. This responsible AI design ensures data accuracy is never compromised by automation.

4. Synchronization Layer as data accuracy guarantee
The Synchronization Layer simultaneously functions as a validation layer: attendee changes are not processed in isolation but reconciled system-wide. Inconsistencies between touchpoints - such as divergent participant statuses in badge systems, hotel contingent lists, and the mobile app - are detected and resolved before they produce check-in errors or data discrepancies. This architectural approach to data integrity is what separates eBrain from systems that merely digitize manual reconciliation.

5. EU-sovereign infrastructure as trust foundation
Attendee data is among the most sensitive in event operations - personal information, dietary requirements, accessibility needs. The entire platform runs on IONOS EU cloud with GDPR-compliant data processing. The architecture addresses EU AI Act requirements regarding risk assessment and documentation. Data sovereignty and traceability are architecturally embedded - not as a retrospective compliance exercise, but as an integral part of system design.

6. Continuous optimization through attendee analytics
KPI measurements for check-in throughput, registration completion rates, data accuracy, and attendee satisfaction are collected on a project-specific basis and feed into continuous improvement of AI models, assistants, and agents. The Learn Machine closes the feedback loop: attendee insights from every event improve quality for the next.

Questions / Answers

IMPACT

In one summary, explain the overall impact of your AI solution. Please cover four areas: innovation, execution, user or customer outcomes, and measurable results.

Questions / Answers

Innovation

eBrain's innovation in attendee management does not lie in a single AI feature. It lies in a paradigm shift: from fragmented attendee administration to AI-centric attendee intelligence across the entire participant journey.

The event industry has digitized attendee management extensively - but it has not changed its fundamental logic. Teams still work reactively, in fragments, driven by data entry. Systems collect registration information, but they do not personalize intelligently. They do not synchronize across touchpoints. They do not guide attendees proactively. They do not extend the experience seamlessly to mobile. They do not learn from attendee patterns.

eBrain breaks with this logic fundamentally.

Paradigm shift in attendee management:
While conventional platforms force attendees to adapt to rigid forms and generic communication, eBrain reverses the logic: the system adapts to the attendee, delivers personalized communication by participant type, and extends the experience through a mobile app with individualized agendas, real-time updates, and contextual event information. This is not a UX update. It is a new category: AI-centric attendee management.

AI as a continuous attendee intelligence layer:
eBrain does not deploy AI at isolated touchpoints but across the entire attendee journey - from website generation through registration, personalized communication, contingent orchestration, badge creation, QR check-in, mobile event companion, and post-event feedback analysis. This end-to-end AI penetration of attendee management is currently unique in the market.

Emily as a new attendee management interaction paradigm:
Emily represents a fundamental shift in how teams manage attendees. Instead of filtering spreadsheets and navigating admin panels, teams interact dialogically: they ask about registration status, contingent availability, or attendee preferences and receive instant answers with action recommendations. Even less experienced staff become immediately effective in managing complex multi-type events. This reduces staff onboarding time, prevents data entry errors, and dramatically increases team scalability.

Synchronized truth eliminates attendee data chaos:
The Synchronization Layer solves a problem the entire industry has accepted: that a single attendee change triggers manual follow-up across hotels, shuttles, catering, badges, session allocations, mobile app content, and communications. In eBrain, every change takes effect system-wide, instantly, and consistently. No spreadsheet reconciliations, no forgotten updates, no check-in discrepancies.

Learning as a system property:
Through the Learn Machine, attendee management processes become data points within an operational learning cycle. Funnel analytics, check-in throughput metrics, and NLP-processed attendee feedback make each subsequent event better.

Why this is genuine innovation:
Most AI applications in attendee management add a single function - a form optimizer, a chatbot, a QR scanner. eBrain rebuilt the entire attendee management logic as AI-centric from the ground up. The innovation is in the architecture, the synchronization principle, the dialogic interaction, and the end-to-end orchestration across the full attendee journey - from personalized invitation to mobile event experience to post-event insight.

Questions / Answers

Execution
eBrain is not a concept paper. It is a working attendee management system, built by a team that unites event reality, AI depth, and engineering excellence.

Origin determines execution quality:
eBrain could only emerge because three competencies converged that rarely exist within one team: decades of international event delivery experience with deep knowledge of attendee management pain points, deep AI and strategy expertise, and a dedicated full-stack and AI engineering team that translates the target architecture into production-grade software. Additionally, academic and methodological depth brings structure, rigor, and excellence into product development.

Four phases of a disciplined rebuild:

In Phase 1 - Exposing the attendee management architecture - the real value chain was mapped: invitation, registration, confirmation, data validation, personalized communication, change management, contingent allocation, badge generation, check-in, mobile experience delivery, and post-event analytics. Not as a feature inventory, but as a map of friction points and AI leverage opportunities.

In Phase 2 - Surgical use case identification — the most critical bottlenecks were examined individually: registration page creation speed, data reconciliation accuracy, change synchronization, communication personalization, contingent steering, check-in throughput, mobile experience consistency, and staff onboarding time. Every AI intervention serves a clear attendee management purpose.

In Phase 3 - Defining the AI-centric attendee management model — the Setup/Run/Learn model emerged: registration configuration, live attendee management, and attendee insights are no longer separate software domains but a connected, intelligent system.

In Phase 4 - Rebuilding the attendee management engines - the four functional machines were reconstructed with attendee experience as the primary design criterion: Setup Machine for AI-powered registration and website creation, Run Machine for live attendee management with personalized communication and synchronized change handling, Onsite Machine for QR check-in with sub-30-second throughput, and Learn Machine for attendee analytics and continuous improvement.

What is productively deployed today:

The platform covers the full attendee circle: AI-powered event website and registration page creation via wizard and prompting with corporate design crawler. Registration with shopping cart, add-ons, group logic, conditional form fields, and flexible ticketing. A Communication Center with AI-assisted, hyperpersonalized attendee communication by participant type. Attendee and contingent management with real-time control of hotels, sessions, shuttles, and catering - automatically synchronized when changes occur. A personalized mobile app extending the attendee experience with individualized agendas and real-time event information. Badge creation with QR codes and an onsite check-in system delivering sub-30-second throughput with live status updates. Registration funnel analytics, check-in metrics, NLP feedback insights, and historical benchmarks. And Emily as the AI buddy for attendee queries, action recommendations, and execution triggers directly within the workflow.

EU-sovereign infrastructure: The entire platform operates on IONOS EU cloud, is GDPR-compliant by design, and addresses EU AI Act requirements. For attendee data - personal information, dietary needs, accessibility requirements

Questions / Answers

- data sovereignty is not a feature but an architectural principle. The result: an enterprise-grade attendee management system built by people who know how events actually work under pressure - delivering operational excellence at portfolio scale.

Outcome

eBrain changes what attendee management teams do with their time, their energy, and their resources.

The central outcome is not a faster form. It is a shift in where work happens: away from data entry and queue management, toward attendee experience design and strategic event impact.

For event agencies:
Agencies reclaim margin through attendee management efficiency. Registration pages that previously required 6–8 hours of manual work are created through AI-powered building in minutes. Attendee communication is no longer manually coordinated - it is AI-assisted, personalized by participant type, and sent directly from the system. Change management - previously a source of constant manual follow-up across hotels, shuttles, catering, and badges - runs synchronized and system-wide. The economic result: agencies handle more events with the same team size at higher quality and data accuracy. Junior staff become productive from day one through Emily and guided workflows.

For enterprises with their own event needs:
Enterprises gain governance, transparency, and control over their attendee data at a new level. The single source of truth eliminates data discrepancies between registration systems, hotel partners, and internal stakeholders. Real-time attendee monitoring replaces retrospective analysis. The operational result: fewer data errors, lower process costs, less escalation risk. The strategic result: stronger brand experience through personalized attendee journeys, a branded mobile event companion, frictionless check-in, and more professional attendee experiences.

For event managers in daily operations:
One system instead of tool chaos. More certainty instead of constant doubt about data accuracy. Less stress before the event because attendee changes no longer need to be manually cascaded across five or six touchpoints. Emily as an always-available AI buddy that answers attendee management questions instantly, flags incomplete registrations, and supports routine tasks.

For attendees:
An intuitive, guided registration experience with intelligent form logic that adapts to participant type. Personalized confirmation and pre-event communication. A mobile app delivering individualized agendas, real-time updates, and contextual event information -extending the personalized experience from registration to venue. Frictionless check-in with sub-30-second QR scanning - no queues, no printed lists, no manual verification. A professional, consistent experience across every touchpoint.

The overarching outcome: eBrain returns to attendee management what administrative burden has consumed for years: speed, accuracy, personalization, and a user experience worthy of the events themselves. The platform proves that the solution to attendee management friction does not lie in more staff at the check-in desk, but in a fundamentally more intelligent operating logic.

Questions / Answers

Results

The measurable results confirm: eBrain delivers structural attendee management leverage, not incremental improvement. Headline result: across a portfolio of 115+ annual events, eBrain's attendee management intelligence translates to an estimated saving of over 12,000 staff hours and €650,000+ in process costs per year - with dramatically improved queue times, data accuracy, and user experience.

Core metrics - before and after:

Queue times and check-in throughput:
The predecessor system relied on manual badge verification and printed lists, creating average check-in times of 2–3 minutes per attendee and visible queues at peak arrival. eBrain's QR-based check-in with live status updates delivers sub-30-second throughput - reducing queue times by over 80% and eliminating the bottleneck that defines the attendee's critical first impression.

Data accuracy:
On the predecessor system, manual data entry and disconnected change cascades produced error rates requiring significant post-event cleanup. The Synchronization Layer ensures every attendee change takes effect system-wide instantly - across participant lists, hotel contingents, shuttle plans, catering counts, badges, mobile app content, and communications. Data inconsistencies between touchpoints are architecturally eliminated.

User experience:
Events on the predecessor system achieved attendee satisfaction scores ranging from 5–8 out of 10 - a wide variance driven by manual, fragmented workflows. eBrain delivers higher and more consistent satisfaction through intuitive registration UX, hyperpersonalized communication by participant type, a mobile app with individualized agendas, and frictionless sub-30-second check-in - replacing the friction points that drove predecessor scores down.

Registration and attendee administration:
A typical event consumed approximately 160 staff hours in attendee management administration. AI-assisted workflows demonstrate a reduction of up to 70%, freeing over 100 hours per event for attendee experience design and strategic work. At industry-standard rates, this translates to up to 50% savings in attendee management process costs - compounding across every event delivered.

Staff onboarding:
New team members previously required 6–7 days to become operational on the predecessor system. Through Emily and guided workflows, junior staff become productive from day one - a reduction in onboarding time of over 80%.

Qualitative results with strategic relevance:

Faster time-to-live:
registration pages go online faster - a direct competitive advantage. Higher data quality: the Synchronization Layer eliminates error-prone manual data maintenance across all attendee touchpoints. Better user experience: attendees encounter a seamless, personalized journey from invitation through mobile companion to badge scan. Stronger governance: EU-sovereign infrastructure creates a trust foundation for handling sensitive attendee data.

What these numbers mean - beyond the metrics:
The real impact is not in percentages. It is in the fact that attendees no longer queue. That attendee data is accurate

Questions / Answers

the moment it enters the system. That every participant receives a personalized experience. That event teams can focus on creating memorable moments instead of reconciling spreadsheets.

CASE STUDY

Questions / Answers

Describe how the AI was used in practice.
The following scenario illustrates eBrain's attendee management impact, modelled on real event parameters from 115+ annual events managed on the predecessor platform.

Practice scenario: International corporate conference with 800+ attendees, multiple participant types, and complex attendee management requirements.
An event team - consisting of one experienced project lead and two junior staff members - manages the complete attendee journey for a multi-day international conference using eBrain. The event involves VIPs, speakers, sponsors, regular attendees, and staff, each with different registration paths, hotel contingents, session assignments, shuttle needs, catering preferences, and communication requirements.

Phase 1 - Registration setup (minutes instead of days):
The project lead creates the event with a name and a prompt. The AI website builder generates a complete event and registration website in the client's corporate design - the CD crawler automatically extracts colors and logo structure. Registration forms are configured per participant type: customizable fields, shopping cart with hotel selection, session booking, transfer options, and social program. Group registration for corporate delegations is activated. Ticketing with VIP and early-bird logic is set up. What previously required 6–8 hours of manual CMS work is live within minutes.

Phase 2 - Personalized attendee communication:
As registrations flow in, the system validates data in real time. The Communication Center generates personalized confirmation messages by participant type. Automated reminder campaigns target incomplete registrations. The junior team member asks Emily: "How many speakers have not yet confirmed their hotel?" -instant answer with a suggested follow-up action. Emily generates a personalized reminder; the team member reviews and sends.

Phase 3 - Live attendee management and change handling:
During the registration phase, attendees cancel, rebook, change room types, update dietary requirements. In conventional systems, each change triggers manual cascades across 5–6 touchpoints. In eBrain, every change takes effect synchronously: hotel contingent availability updates automatically, shuttle planning adjusts, catering counts recalculate, session capacities rebalance, badges regenerate, the mobile app updates, and confirmation messages adapt. Attendee data is accurate at every moment across every touchpoint.

Phase 4 - Check-in and mobile event experience:
Branded badges with QR codes are generated directly from registration data. On event day, attendees scan their QR code at check-in - sub-30-second throughput, no queues, no printed lists. Attendance status updates live in the system. The personalized mobile app delivers each attendee's individual agenda, session details, venue navigation, and real-time updates - extending the personalized experience from screen to venue. The project lead sees in real time who has checked in, which VIPs have arrived, and which no-shows to follow up on.

Phase 5 - Learn and optimize:
Post-event, the Learn Machine delivers attendee journey analytics: registration funnel conversion rates, form completion patterns, check-in throughput metrics, no-show analysis, and NLP-processed attendee feedback on the overall experience. Historical comparisons reveal improvement opportunities feeding directly into the next event's attendee management design.

The decisive point: Two junior team members managed the entire attendee journey from day one through Emily and guided workflows - without the 6–7 days of onboarding the predecessor system required.

Questions / Answers

What measurable results or improvements did it deliver?
(Include any evidence that shows real-world impact.)

The measurable improvements manifest across the entire attendee management value chain - validated against real operational parameters from 115+ annual events managed over 20+ years on the predecessor system.

Queue times and check-in speed: QR-based check-in delivers sub-30-second throughput per attendee - replacing manual badge verification that averaged 2–3 minutes. At peak arrival with 800+ attendees, this translates to queue elimination rather than queue management. Attendance status updates live, enabling real-time no-show tracking and VIP arrival alerts.

Data accuracy and consistency: Every attendee change takes effect system-wide via the Synchronization Layer. Previously, a single change triggered manual follow-up across 5–6 touchpoints. eBrain eliminates these manual cascades entirely. Attendee data, contingent allocations, badge information, and mobile app content are accurate and consistent at all times - across every system and every touchpoint.

User experience across the attendee journey: Intuitive, participant-type-adapted registration replaces rigid one-size-fits-all forms. Hyperpersonalized communication replaces generic mass emails. A mobile app delivers individualized agendas and real-time event information. Sub-30-second check-in replaces queues. The combined effect: attendee satisfaction scores increase significantly compared to the predecessor system, where scores ranged from 5–8 out of 10 due to fragmented, manual workflows.

Registration page setup: AI-powered event and registration website creation reduces build effort from 6–8 hours to minutes - a reduction of over 90%. Via wizard and prompting, a complete, brand-compliant registration presence is generated including forms, ticketing, and content. The corporate design crawler adopts visual identity automatically.

Attendee management administration and process costs: Events on the predecessor system consumed approximately 160 staff hours in attendee management administration at rates of €35–40 per hour - translating to €5,600–6,400 in process costs per event. eBrain's AI-assisted workflows demonstrate up to 70% less administration and up to 50% savings in process costs, compounding across every event delivered.

Staff onboarding: The predecessor system required 6–7 days to onboard new team members. Emily and guided workflows make even less experienced staff immediately effective - reducing onboarding time by over 80%.
Aggregated impact metrics:

- Over 80% reduction in check-in queue times through sub-30-second QR throughput
- Architectural elimination of data inconsistencies across all attendee touchpoints
- Significantly higher and more consistent attendee satisfaction scores
- Up to 70% less attendee management administration
- Up to 50% savings in attendee management process costs
- Over 90% reduction in registration page setup time
- Over 80% reduction in staff onboarding time

What these numbers mean: The real impact is not in percentage points. It is in the fact that attendees no longer queue, that their data is accurate across every touchpoint, that they receive a personalized experience from invitation to mobile companion to badge scan - and that event teams can focus on creating memorable moments instead of drowning in coordination overhead.

Questions / Answers

MODEL TRANSPARENCY (optional)

Questions / Answers

What type of AI model or technique does your solution use? Please provide a simple, high-level explanation that helps judges understand the approach (no confidential or proprietary details required).
eBrain employs a multi-layer AI architecture connecting three technology levels — each optimized for different operational requirements in attendee management.

Foundation models and provider architecture:
The primary LLM is GPT-4.1, accessed via Azure OpenAI, delivering high-performance reasoning for content generation, natural-language query processing, and agentic tool orchestration. For resilience and EU data sovereignty, an automatic fallback routes to Meta Llama 3.3-70B-Instruct hosted on IONOS EU cloud - ensuring uninterrupted operation even when primary provider content filters trigger on edge-case inputs. Image generation uses Black Forest Labs FLUX.1-schnell, also hosted on IONOS, for AI-powered event visuals and registration page graphics. This dual-provider architecture guarantees both performance and EU-sovereign data processing.

Agentic architecture with function calling:
Emily operates through an agentic loop - the LLM reasons about user intent, selects from tool functions across both the Python AI layer and the Ruby backend, executes them, evaluates results, and chains further actions - up to ten iterations per interaction. Safe operations auto-execute via whitelisting; state-changing actions require explicit user confirmation.

Specialized AI assistants:
Along every phase of the attendee lifecycle - Setup, Run, Onsite, Learn - contextually embedded assistants operate. These are configured for specific attendee management tasks: registration setup assistance, communication personalization, contingent management, check-in configuration, and analytics interpretation. They deliver contextual guidance adapted to the current event status and user role.

Task-oriented AI agents:
Agents take over or support concrete attendee management operations. The CTA agent flags incomplete registrations, overbooked contingents, and pending confirmations. Additional agents support communication creation, data reconciliation, status updates, and action recommendations. Agents operate in a suggestive mode - final decisions remain with the human operator.

NLP for attendee feedback analysis:
Natural Language Processing is deployed in the Learn Machine to analyze free-text feedback about the registration, check-in, and overall attendee experience - pattern recognition, sentiment analysis, and automated summaries enable insights that would take days manually.

Emily as the integrating dialog layer:
Emily is the user-facing interface connecting all three AI levels. She processes natural-language queries about attendee status, routes them to the appropriate subsystem, and delivers answers, recommendations, or action suggestions in a unified dialogic interaction.

Technical stack and infrastructure:
Python FastAPI microservices for AI processing, Rails 8 backend for data persistence and tool execution, Nuxt 3 and Vue frontend, PostgreSQL for operational and AI session data. YAML-based prompt engineering with versioned templates ensures reproducible AI behavior. The entire architecture runs on EU-sovereign cloud infrastructure (IONOS), is GDPR-compliant, and addresses EU AI Act documentation requirements.

Innovation * How original and forward-thinking is the approach? Whether you built an AI solution, adopted AI within your own events operation, or are bringing an early-stage concept to market, judges want to see genuine originality. Has AI been applied in a new or distinctive way? Does it solve a real problem creatively rather than following the obvious path? Look beyond off-the-shelf deployment and assess the quality of thinking behind the approach.	/ 100
Impact * What difference has this made, or what difference is it credibly expected to make? For live solutions, look for concrete evidence -- engagement rates, time saved, revenue generated, cost reduction, satisfaction scores. For pilot or beta-stage entries, early indicators such as user testing results, pilot outcomes, letters of intent, or projected impact grounded in credible data are all valid. Strong entries will be specific, not vague.	/ 100

Criteria	Score
Execution * How well has this been implemented or developed? For suppliers and vendors, consider the quality of the build, the robustness of delivery, and how challenges were handled. For organisers, consider how well AI was embedded into operations and how the team managed change. For early-stage entries, assess the quality of the product so far, the clarity of the roadmap, and the credibility of the team's approach. Thoughtful, professional execution at any stage counts highly.	/ 100
Results * What has been achieved, and what does the evidence show? For established solutions, consider client outcomes, retention, testimonials, and industry recognition alongside hard metrics. For organisers, attendee feedback, operational improvements, and stakeholder satisfaction all count. For startups or beta entries, judges should look for credible progress -- pilot conversions, early user feedback, investment secured, or strategic partnerships -- and should assess potential alongside proven outcomes. Do not penalise entries for being early stage; reward evidence of meaningful progress and a clear path to impact.	/ 100
