COMPANY INFORMATION

Company / Organisation Name
gassProductions

Product Name (optional)
AI-Assisted Multi-Camera Live Production

Questions / Answers

Company profile

gassProductions is a specialist multi-camera production and live streaming company founded in 2006, based in Kent, UK. We deliver vision mixing, camera operation, and live streaming services for corporate events, product launches, conferences, and creative brand activations across the UK and internationally.

Our client roster includes some of the world's most recognised technology and consumer brands — Sony, Adobe, Google, AWS, Microsoft, BMW, and Goldwell among them. We're trusted to deliver technically demanding, high-profile productions where failure isn't an option.

In 2024, gassProductions became one of the first UK production companies to adopt Sony's BRC-AM7 AI PTZ camera system for live event work. Rather than simply deploying new equipment, we developed a complete production methodology around AI-assisted camera operation — separating mechanical tracking from creative decision-making. This approach has become our standard operating model for corporate events.

Our work with the BRC-AM7 led to a direct feedback relationship with Sony's R&D team, contributing to four firmware improvements shipped in the V3.0 update announced at ISE 2026. Sony subsequently commissioned gassProductions to produce the official global case study film documenting our methodology and results.

We're a focused team combining deep technical expertise with creative storytelling.

YOUR PRODUCT

Questions / Answers

Description of your technology

This entry documents the collaboration between gassProductions and Vibration Production — a partnership that demonstrates how specialist AI expertise can be embedded within a broader event production to deliver results neither party could achieve alone.

Vibration Production is an established professional AV company that manages end-to-end event delivery for corporate clients. For Goldwell's Celebration of Color — a flagship runway show at Exhibition White City, London — they needed broadcast-quality multi-camera coverage with minimal crew footprint and compact physical presence. Rather than hiring a traditional five-person camera crew, they engaged gassProductions specifically for our AI camera methodology and expertise.

This wasn't equipment hire. It was an embedded specialist partnership where gassProductions integrated as Vibration's video production team, bringing methodology, expertise, and technology as a single turnkey package. Vibration contributed event management expertise, client relationship management, and overall AV production — while gassProductions provided AI-assisted multi-camera coverage using five Sony BRC-AM7 cameras operated by two crew members.

The results justified the collaboration approach. Two operators delivered broadcast-grade five-camera coverage — a 60% crew reduction — with quality independently verified by Vibration Production's Director, Niall Spierin: "They setup with a fraction of the footprint and crew we'd normally expect — without compromising broadcast quality."

The partnership model addresses a real industry challenge. AI camera technology is advancing rapidly, but most AV companies lack the specialist knowledge, operational experience, or developed methodology to deploy it effectively. Buying the cameras isn't enough — you need to understand how to configure AI tracking parameters for specific event scenarios, how to plan camera positions for optimal AI performance, and how to build a production workflow that lets operators focus on creativity while AI handles mechanics.

By engaging gassProductions as an embedded specialist partner, Vibration Production gained access to this entire capability stack without needing to develop it in-house. They could offer their client (Goldwell) a level of production sophistication that would otherwise be unavailable — all while maintaining their existing client relationship and event management responsibilities.

The collaboration was so successful that Sony Professional Europe commissioned gassProductions to produce the official global case study film documenting the methodology and results. Our production feedback also contributed to four firmware improvements in Sony's V3.0 update announced at ISE 2026.

Spierin captured the partnership value: "They don't just turn up with cameras — they arrive with solutions. That's why we trust them on technically demanding live shows."

This model is replicable. Any AV agency can engage a specialist AI camera partner for specific events, gaining broadcast capability without capital investment in equipment or training. It's a scalable industry model that accelerates AI adoption by removing the knowledge barrier that currently limits it.

TECHNOLOGY DESCRIPTION

Questions / Answers

Explain how the AI works in your solution?

The Sony BRC-AM7 uses on-device AI powered by Sony's BIONZ XR processor — the same chip found in their flagship cinema and mirrorless cameras. All AI inference runs locally on the camera hardware with zero cloud dependency, zero data transmission, and zero latency.

The AI engine performs real-time skeletal tracking, head detection, face recognition (with priority subject registration), and clothing pattern analysis to maintain consistent framing of moving subjects. It can simultaneously track up to 8 individuals across more than 150 composition presets, automatically adjusting pan, tilt, and zoom to keep subjects framed according to operator-defined parameters.

The camera features a 1.0-inch Exmor RS CMOS sensor with 20x optical zoom (24–480mm equivalent) and up to 40x Clear Image Zoom in Full HD — delivering broadcast-quality imagery that matches or exceeds traditional manned camera positions.

Critically, the AI handles the mechanical burden of tracking — the repetitive pan/tilt/zoom adjustments that traditionally consume approximately 80% of a camera operator's attention. Manual operator override is available at any time, allowing instant human intervention for creative decisions or unexpected scenarios. This is not fully autonomous filming — it's AI-assisted production where the technology handles mechanics and humans retain complete creative control.

What specific problem does this AI solve?

AV agencies face a growing challenge: clients expect broadcast-quality multi-camera coverage, but delivering it traditionally requires large crews, significant floor space, and budgets many events can't support. At the same time, AI camera technology is advancing — but most agencies lack the specialist knowledge and operational methodology to deploy it effectively.

Simply purchasing AI cameras doesn't solve the problem. Without developed methodology and understanding of how to configure AI tracking for specific scenarios, agencies risk deploying expensive technology that underperforms — or fails during live shows.

Vibration Production faced this challenge for Goldwell's Celebration of Color. They needed broadcast-quality coverage with minimal crew and compact footprint, but lacked in-house AI camera expertise. Hiring a traditional five-person crew would solve the quality problem but not the crew or footprint constraints.

Our collaboration solved this by providing methodology, expertise, and technology as a single embedded package. Vibration gained broadcast capability without developing in-house AI expertise. gassProductions gained a commercial deployment validating our methodology. The client received production quality exceeding expectations at lower cost.

This model removes the knowledge barrier that currently limits AI adoption across the events industry.

Questions / Answers

What makes your approach different or innovative?
This partnership removed the single biggest barrier to AI adoption in live events: the knowledge gap. Vibration Production accessed proven AI methodology overnight, without equipment investment, staff training, or deployment risk.

Most AI adoption follows a costly, high-risk path: companies purchase cameras, hire consultants, run pilots, iterate through failures on their own events. Our embedded specialist model eliminates this. By engaging gassProductions as a turnkey AI partner, Vibration Production accessed methodology proven through multiple live deployments, configured for immediate use, and backed by a team with operational expertise.

This partnership is fundamentally different from equipment supply or contractor engagement. It combines complementary expertise for outcomes neither party could achieve independently. Vibration brought event management knowledge, client relationships, and venue logistics. gassProductions brought AI methodology, production expertise, and operational experience. The result: broadcast-quality production that elevated Vibration's service offering without diverting them from core business.

The collaboration advanced technology and industry. Our operational feedback shaped four Sony firmware improvements. Sony commissioned the global case study. At ISE 2026, the partnership was featured as a model for industry-wide AI adoption. We demonstrated a scalable partnership model that removes adoption barriers for AV agencies worldwide.

VALIDATION

Questions / Answers

How did you test, validate, or quality-check the AI outputs to ensure they were accurate, safe, or reliable?
The collaboration was validated through live deployment at one of the most demanding event types for AI-assisted production: a fast-paced runway show with zero margin for error.

Goldwell's Celebration of Color, held at Exhibition White City, London, presented every challenge that tests both a production methodology and a partnership model: rapid performer movement, dramatic lighting changes (critical for a hair colour brand), multiple performers in close proximity, and an audience of industry professionals expecting broadcast-quality results. If the collaboration failed — whether through technology issues, communication breakdowns, or methodology problems — it would fail visibly and consequentially.

The partnership structure itself was part of the validation. Vibration Production and gassProductions operated as complementary specialist teams: Vibration managed overall event AV, client communications, and venue logistics, while gassProductions managed the AI camera deployment, vision mixing, and live production. This required clear role definition, shared planning, and trust — all elements of a successful collaboration that were tested under real pressure.

Joint pre-production planning covered camera positions optimised for AI tracking performance, framing parameters for each camera, contingency plans for AI tracking edge cases, and integration points between the camera production and Vibration's wider AV setup (audio feeds, lighting coordination, power and data routing).

During the live show, the collaboration performed seamlessly. The AI operated at approximately 90% autonomy. gassProductions' two operators managed all five cameras' creative output while Vibration's team managed the broader event production. There were no communication breakdowns, no role confusion, and no quality compromises.

The strongest validation comes from Vibration Production themselves. Director Niall Spierin provided two statements that directly assess the collaboration: "They setup with a fraction of the footprint and crew we'd normally expect — without compromising broadcast quality" — confirming that the embedded specialist model delivered on its core promise of equivalent quality with reduced resources. And: "They don't just turn up with cameras — they arrive with solutions. That's why we trust them on technically demanding live shows" — confirming that the partnership value extends beyond equipment to encompass methodology and expertise.

The word "trust" in Spierin's statement is particularly significant for a collaboration entry. Trust between partner organisations is earned through reliable delivery, and his willingness to publicly endorse the partnership indicates confidence in its repeatability.

Sony Professional Europe added manufacturer-level validation by commissioning gassProductions to produce the official global case study film. Sony's interest wasn't just in the technology — it was in how the collaboration model demonstrated their AI cameras being deployed effectively in a real event production context. The partnership between a specialist AI production company and an established AV agency represents exactly the adoption model Sony wants to see replicated globally.

The case study was showcased at ISE 2026, the world's largest professional AV trade show, alongside the V3.0 firmware announcement. Our production feedback from the Goldwell collaboration directly informed four firmware improvements — demonstrating that the partnership generated value not just for the two companies involved but for the technology platform's entire global user base.

Questions / Answers

IMPACT

In one summary, explain the overall impact of your AI solution. Please cover four areas: innovation, execution, user or customer outcomes, and measurable results.

Questions / Answers

Innovation

The innovation is the partnership model itself — an embedded specialist approach to AI deployment that solves the adoption barrier most AV agencies face.

The events industry is at an inflection point with AI technology. Camera systems like the Sony BRC-AM7 offer genuine improvements, but adoption remains limited because the technology requires specialist knowledge to deploy effectively. Most AV agencies lack in-house AI camera expertise, and learning curves — through trial and error on live events — are prohibitively risky.

Our collaboration with Vibration Production pioneered a solution: the embedded specialist model. Rather than Vibration purchasing AI cameras and developing methodology independently, they engaged gassProductions as a turnkey AI video partner. We integrated as their video production team, bringing methodology, operational expertise, and technology as one package.

This model eliminates the knowledge barrier without requiring agencies to build capability. Vibration Production gained immediate access to a proven, operational AI methodology developed, tested, refined, and validated through live deployments. They didn't need to buy equipment, train staff, or risk unfamiliar technology on high-stakes events.

The innovation extends to partnership structure. This wasn't a subcontractor arrangement where gassProductions simply provided cameras and operators. It was a genuine partnership where each party contributed complementary expertise: Vibration's event management knowledge, client relationships, and venue logistics combined with gassProductions' AI methodology, production expertise, and technology. The result exceeded what either party could achieve independently.

For Vibration Production, the collaboration provided competitive advantage — they could offer clients a production sophistication few AV agencies deliver. Five-camera broadcast coverage with two crew, compact footprint, and AI-assisted quality. Without partnership, this would require either much larger crew budgets or in-house AI programs.

For gassProductions, the collaboration provided a commercial model scaling our methodology beyond events we manage directly. By partnering with established agencies, we deploy AI-assisted production across wider event ranges — reaching clients and sectors independently inaccessible.

The collaboration generated innovation beyond the two companies. Our operational feedback from Goldwell contributed to four Sony firmware improvements in the V3.0 update — benefits every BRC-AM7 operator worldwide. The official case study film Sony commissioned documents the partnership model, providing a blueprint for similar partnerships globally.

At ISE 2026, the collaboration was showcased alongside the V3.0 announcement — demonstrating to the global AV industry that specialist partnerships can accelerate AI adoption more effectively than companies trying to develop all capabilities in-house.

The model is inherently replicable and scalable. Any AV agency can engage a specialist AI camera partner for events requiring broadcast-quality coverage. The partnership requires no permanent staffing changes or capital investment — it's a project-based collaboration scaling based on event requirements.

Questions / Answers

Execution

Joint planning between gassProductions and Vibration Production optimised every element of the AI deployment — from camera positions and tracking parameters to power routing and audience sightlines — demonstrating the value of complementary expertise.

The collaboration was executed at Goldwell's Celebration of Color — a flagship runway show at Exhibition White City, London — where Vibration Production engaged gassProductions as their specialist AI partner.

The partnership began with joint pre-production planning. Vibration Production shared their event brief, venue plans, and requirements. gassProductions contributed AI camera deployment expertise — recommending camera positions, defining framing parameters, and planning the workflow around the two-operator AI-assisted model.

This planning was genuinely collaborative. Vibration's venue knowledge informed practical decisions about camera placement (power, cable runs, sightlines), while gassProductions' AI expertise determined technical parameters (tracking distances, lens selection, AI configuration for runway movement patterns). Neither party could have optimised the deployment independently.

Camera positions provided comprehensive coverage while maximising tracking reliability: clear sightlines along the catwalk, appropriate distances for the BRC-AM7's zoom, and positions allowing AI to track performers through the complete walk-turn-return sequence. Priority subject registration was configured for featured models.

On event day, the complementary expertise was evident. Vibration managed overall event AV — audio, lighting, venue logistics, and client communications. gassProductions deployed and operated five Sony BRC-AM7 AI PTZ cameras with two crew members, managing vision mixing, shading, and ISO recording.

Physical integration was seamless. Compact PTZ positions sat within Vibration's infrastructure without conflicts or requiring additional space — a practical benefit demonstrating the AI deployment complementing existing AV setups rather than competing for resources.

During the live show, the AI operated at approximately 90% autonomy. Operators focused on creative management of all five feeds — composition, shot selection, vision mixing, and real-time shading for colour consistency (critical for a hair colour brand). Production responsibilities separated cleanly and effectively.

Post-event, we conducted joint review sessions. Vibration provided feedback on AI deployment integration with their wider production. gassProductions documented technical performance — tracking accuracy, edge cases, and environmental factors. This collaborative review strengthened the partnership.

gassProductions then produced the official Sony case study film commissioned by Sony Professional Europe, documenting the collaboration model with behind-the-scenes footage, methodology explanation, and interviews including Vibration's Director Niall Spierin's endorsement.

Technical reviews formed structured feedback delivered to Sony's R&D team, directly informing four V3.0 firmware improvements announced at ISE 2026. The case study was showcased at ISE — demonstrating the collaboration's impact on the industry's most prominent stage.

Questions / Answers

Outcome

The collaboration proved that specialist AI partnerships deliver faster, lower-risk AI adoption than any company attempting to build capability alone.

The partnership delivered outcomes across four levels: event delivery, partnership model validation, technology advancement, and industry influence.

At the event level, the collaboration was unambiguous success. Two operators delivered broadcast-grade five-camera coverage of a demanding runway show — Goldwell's Celebration of Color — with quality that Vibration Production's Director confirmed met broadcast standards. The client received coverage exceeding what traditional deployment would typically deliver.

The reduced physical footprint provided practical benefits: compact PTZ positions freed floor space that Vibration used for wider AV needs, and increased audience seating capacity improved the event experience.

At the partnership model level, the collaboration validated the embedded specialist approach. Vibration Production gained AI-assisted broadcast production capability without usual barriers: no capital investment, no training, no methodology development. They engaged a specialist partner with proven methodology and received predictable, professional results.

Spierin's statements validate this model. "They don't just turn up with cameras — they arrive with solutions" confirms the partnership delivers methodology, not just equipment. "That's why we trust them on technically demanding live shows" confirms repeatable trust for future engagements.

The model is now replicable. AV agencies can engage specialist AI camera partners for events, gaining broadcast capability without permanent overhead. This project-based structure scales naturally.

At the technology level, the collaboration advanced the AI camera platform. Operational data from Goldwell was systematically documented and shared with Sony's R&D team. Four specific firmware improvements in V3.0 — optical image stabilisation for long-lens tracking, Tracking Range Zone overlays, PTZ Speed Adjustment during auto-framing, and improved control visibility — are directly traceable to this feedback.

This demonstrates that collaborative deployments between specialist AI companies and AV agencies generate technology insights benefiting the entire industry. Real-world events present challenges laboratory testing cannot replicate, and partnerships deploying AI in demanding environments drive platform improvement.

At the industry level, Sony's decision to commission the global case study film — and showcase it at ISE 2026 — established the collaboration as a reference model for AI adoption in events. The film documents the partnership structure, providing a blueprint the global AV industry can learn from.

The ISE 2026 showcase connected the collaboration to the V3.0 firmware announcement, demonstrating that specialist partnerships accelerate both AI adoption and technology development simultaneously.

This collaboration proves AI adoption in events doesn't require every company becoming an AI expert. It requires the right partnerships and willingness to combine complementary expertise for outcomes neither party could achieve alone.

Questions / Answers

Results

The collaboration between gassProductions and Vibration Production delivered measurable results.

Crew efficiency: 60% reduction in camera crew requirements. Two operators delivered broadcast-grade five-camera coverage that would traditionally require five operators. This was achieved through the collaborative model — Vibration providing event management and gassProductions providing specialist AI methodology — rather than either party attempting everything independently.

AI autonomy: Approximately 90% autonomous tracking during the live Goldwell's Celebration of Color runway show. The AI tracked performers through sustained walks, directional changes, lighting transitions, and close-proximity moments. Human intervention was approximately 10%, predominantly creative rather than corrective.

Physical footprint: Compact PTZ cameras replaced manned camera platforms, freeing floor space for Vibration's wider AV requirements and increasing audience seating capacity. The AI deployment complemented existing infrastructure rather than competing with it.

Quality verification: Broadcast quality independently confirmed by Vibration Production — the AV partner who engaged gassProductions. Director Niall Spierin: "They setup with a fraction of the footprint and crew we'd normally expect — without compromising broadcast quality." This external validation is particularly significant for collaboration.

Partnership endorsement: Spierin's statement — "They don't just turn up with cameras — they arrive with solutions. That's why we trust them on technically demanding live shows" — validates the collaboration model. The word "trust" confirms this is a repeatable partnership, not an experiment.

Sony case study commission: Sony Professional Europe commissioned gassProductions to produce the official global case study film documenting the collaboration. The film features the partnership model — how specialist AI expertise was embedded within broader event production. It is distributed through Sony Professional's worldwide channels.

Firmware improvements: Four BRC-AM7 V3.0 firmware improvements directly attributable to operational feedback from this deployment: optical image stabilisation for long-lens tracking, Tracking Range Zone overlays for 9:16 monitoring, PTZ Speed Adjustment during auto-framing, and improved interface visibility. Announced at ISE 2026, benefiting all operators globally.

ISE 2026 showcase: The collaboration was featured at the world's largest professional AV trade show, positioning the partnership as a reference for AI adoption across the global events industry.

Industry model: The embedded specialist partnership is now replicable and scalable. Any AV agency can engage specialist AI camera partners for events requiring broadcast-quality coverage — no capital investment, no training program, no technology risk. This removes the primary adoption barrier for most AV companies.

Dan Radford on Sony's platform: "The AI tracking doesn't replace us — it empowers us to be more creative" — reflecting the collaboration's ethos: AI amplifying human capability within trusted partnerships.

Combined value: The collaboration generated measurable value at event level (quality, efficiency), partnership level (trust, repeatability), technology level (firmware improvements), and industry level (case study, ISE showcase). Few AI deployments in events can demonstrate impact across all four levels simultaneously.

Questions / Answers

CASE STUDY

Questions / Answers

Describe how the AI was used in practice.
The case study documents the collaboration between gassProductions and Vibration Production for Goldwell's Celebration of Color — a flagship runway show held at Exhibition White City, London.

Vibration Production, an established professional AV company, was managing overall event delivery for Goldwell. For the multi-camera video production element, they needed broadcast-quality coverage with a minimal crew footprint and compact physical presence — constraints that a traditional five-operator camera crew couldn't meet.

Vibration engaged gassProductions specifically for our AI camera methodology and production expertise. This was a deliberate choice to bring in a specialist partner rather than attempt an AI deployment with general AV staff. The engagement model was embedded partnership: gassProductions integrated as Vibration's video production team for the event, responsible for all camera deployment, operation, vision mixing, and live production.

Joint pre-production planning was a key element of the collaboration. Both teams contributed their respective expertise: Vibration shared venue plans, event schedules, and client requirements. gassProductions recommended camera positions optimised for AI tracking, defined framing parameters for each camera's field of view, and planned the complete production workflow around the two-operator AI-assisted model. Camera positions were also coordinated with Vibration's wider AV setup — lighting positions, audio zones, and power distribution.

Five Sony BRC-AM7 AI PTZ cameras were deployed with two gassProductions crew members. During the live runway show, the AI tracked performers through every phase of the sequence: entrance, forward walk under changing lighting, pause and turn at the runway end, return walk, and exit. The system operated at approximately 90% autonomy, with our operators focusing on creative composition, shot variety, and vision mixing across all five feeds.

The collaboration structure was tested under demanding conditions. The runway show combined rapid performer movement, dramatic lighting transitions (critical for a hair colour brand), multiple performers in close proximity, and zero tolerance for production errors. Both teams needed to execute their respective responsibilities flawlessly and in coordination — there was no room for communication breakdowns or role confusion.

Vibration Production's wider AV team managed audio, lighting coordination, venue logistics, and client communications while gassProductions managed the complete video production. The separation of responsibilities was clean, the integration points were well-defined, and the execution was seamless.

Post-event, Vibration's Director Niall Spierin provided the collaboration's defining testimonials: "They setup with a fraction of the footprint and crew we'd normally expect — without compromising broadcast quality" and "They don't just turn up with cameras — they arrive with solutions. That's why we trust them on technically demanding live shows."

Sony Professional Europe reviewed the collaborative deployment and commissioned gassProductions to produce the official global case study film. The film documents the partnership model — featuring both companies' perspectives, behind-the-scenes collaboration footage, and the production methodology — for distribution through Sony Professional's worldwide channels.

Technical reviews conducted jointly by both teams post-event captured operational insights that formed structured feedback to Sony's R&D team, contributing to four V3.0 firmware improvements announced at ISE 2026. The case study was showcased at ISE alongside this announcement.

Questions / Answers

What measurable results or improvements did it deliver?
(Include any evidence that shows real-world impact.)

The collaboration between gassProductions and Vibration Production at Goldwell's Celebration of Color delivered measurable results.

Crew reduction: Two gassProductions operators delivered broadcast-grade five-camera coverage — a 60% reduction from the five-operator model. Both simultaneously managed vision mixing, camera shading, ISO recording, and creative direction of all five feeds.

AI autonomy: Approximately 90% autonomous tracking during the live runway show. The AI successfully maintained framing through sustained walks, 180-degree directional changes, dramatic lighting transitions, and close-proximity crossovers. Human intervention was approximately 10%, predominantly creative rather than corrective.

Physical footprint: Five compact PTZ cameras replaced five manned camera positions. This directly freed floor space for Vibration's wider AV requirements and increased audience seating capacity. The AI deployment complemented existing infrastructure — a key practical benefit of partnership.

Quality verification: Broadcast quality independently confirmed by Vibration Production's Director Niall Spierin — an experienced AV professional who regularly commissions traditional crews — confirmed no compromise: "They setup with a fraction of the footprint and crew we'd normally expect — without compromising broadcast quality."

Partnership validation: Spierin's endorsement extends beyond quality to partnership model: "They don't just turn up with cameras — they arrive with solutions. That's why we trust them on technically demanding live shows." The use of "trust" confirms an established, repeatable partnership — not a one-off trial.

Colour accuracy: Consistent camera shading across all five feeds ensured accurate colour reproduction. For Goldwell — a professional hair colour brand — this is brand-critical and the collaboration delivered it without additional crew.

Seamless integration: The embedded partnership worked as designed — clean separation of responsibilities, effective joint planning, and coordinated execution. No communication breakdowns or role confusion.

Sony case study commission: Sony Professional Europe commissioned the official global case study film, recognising the collaboration as the most compelling demonstration of their AI technology deployed in partnership. The film is distributed through Sony Professional's worldwide channels.

Firmware improvements: Four BRC-AM7 V3.0 firmware improvements traceable to operational feedback from this deployment: optical image stabilisation for long-lens tracking, Tracking Range Zone overlays, PTZ Speed Adjustment during auto-framing, and improved interface visibility. Announced at ISE 2026, benefiting all operators.

ISE 2026 showcase: The collaboration featured at the world's largest professional AV trade show — establishing the partnership as an industry reference model for AI adoption through specialist collaboration.

Replicable model: The embedded specialist partnership demonstrates a scalable model for AV agencies — combining specialist AI methodology with established event management expertise for outcomes neither party could achieve independently.

Questions / Answers

MODEL TRANSPARENCY (optional)

What type of AI model or technique does your solution use? Please provide a simple, high-level explanation that helps judges understand the approach (no confidential or proprietary details required).
The AI system used in our production methodology is entirely contained within the Sony BRC-AM7 PTZ camera hardware. There is no external AI platform, cloud processing, or third-party machine learning service involved.

The core AI engine runs on Sony's BIONZ XR processor — the same chip used in Sony's flagship Alpha mirrorless cameras. This processor handles all inference tasks locally, ensuring zero-latency response and zero data transmission to external servers.

The AI model performs real-time human pose estimation to identify and track subjects. It analyses body position, movement direction, and spatial relationships to maintain framing as subjects move through the camera's field of view. The system uses a combination of body detection (for initial subject acquisition and wide shots) and face detection (for close-up framing refinement). All processing happens on the BIONZ XR chip within the camera body.

The camera can simultaneously track up to 8 subjects and offers more than 150 composition presets, giving operators granular control over AI framing. These presets define parameters such as headroom, lead room, subject size, and camera response speed.

Hardware specifications relevant to AI performance include: a 1.0-inch Exmor RS CMOS sensor (delivering superior image quality in challenging lighting), 20x optical zoom, up to 40x Clear Image Zoom in Full HD, and 4K/60p recording with simultaneous streaming capability.

Regarding data privacy: because all AI processing happens on-device, no personal data ever leaves the camera hardware. There is no cloud upload, no external data storage, and no transmission mechanism. When powered off, all tracking data is discarded. This makes the system GDPR-compliant for live events, as no personal data is processed beyond real-time, in-camera inference.

The AI operates as an assistive tool, not an autonomous system. At any point, a human operator can override the AI's decisions — adjusting framing, switching subjects, or taking full manual control. Our methodology explicitly preserves human authority: AI handles mechanical tracking while humans make all creative decisions.

Sony's firmware development incorporates improvements directly informed by our production feedback. Version 3.0 (announced at ISE 2026) includes: optical image stabilisation for long-lens AI tracking, Tracking Range Zone overlays for vertical output monitoring, PTZ Speed Adjustment during auto-framing, and improved interface visibility. This demonstrates an active development cycle between manufacturer and production users.

Scoring is incomplete ⚠ Save Cancel

Criteria	Score
Innovation * How original and forward-thinking is the approach? Whether you built an AI solution, adopted AI within your own events operation, or are bringing an early-stage concept to market, judges want to see genuine originality. Has AI been applied in a new or distinctive way? Does it solve a real problem creatively rather than following the obvious path? Look beyond off-the-shelf deployment and assess the quality of thinking behind the approach.	/ 100
Impact * What difference has this made, or what difference is it credibly expected to make? For live solutions, look for concrete evidence -- engagement rates, time saved, revenue generated, cost reduction, satisfaction scores. For pilot or beta-stage entries, early indicators such as user testing results, pilot outcomes, letters of intent, or projected impact grounded in credible data are all valid. Strong entries will be specific, not vague.	/ 100
Execution * How well has this been implemented or developed? For suppliers and vendors, consider the quality of the build, the robustness of delivery, and how challenges were handled. For organisers, consider how well AI was embedded into operations and how the team managed change. For early-stage entries, assess the quality of the product so far, the clarity of the roadmap, and the credibility of the team's approach. Thoughtful, professional execution at any stage counts highly.	/ 100

Recuse yourself if you have a professional or personal conflict of interest

Scoring is incomplete

Criteria	Score
Results * What has been achieved, and what does the evidence show? For established solutions, consider client outcomes, retention, testimonials, and industry recognition alongside hard metrics. For organisers, attendee feedback, operational improvements, and stakeholder satisfaction all count. For startups or beta entries, judges should look for credible progress -- pilot conversions, early user feedback, investment secured, or strategic partnerships -- and should assess potential alongside proven outcomes. Do not penalise entries for being early stage; reward evidence of meaningful progress and a clear path to impact.	/ 100
