COMPANY INFORMATION

Company / Organisation Name
Voxo

Product Name (optional)
Voxo Event

Company profile
Voxo is redefining what events are worth. Built on the conviction that the most valuable knowledge shared at conferences, summits, and corporate events should never disappear into a hallway conversation, Voxo delivers next-generation AI services that capture, transform, and extend event content in real time, at scale. Founded to solve a problem the industry had accepted as inevitable, namely the Forgetting Curve, missed sessions, and the mountain of post-event production work, Voxo has become the infrastructure layer powering some of the world's most prestigious events. From Informa's AI Summit Series in London and New York to HubSpot's global events and Genesys Xperience, Voxo has generated over hundreds of thousands of content downloads across its client portfolio, serving audiences from 400 to 15,000+ attendees. Operating across two entities, Voxo AB in Sweden and Voxo AI LLC in the US, the company serves the global B2B event market with a product that organizers, sponsors, speakers, and attendees all immediately understand the value of. Voxo doesn't just make events smarter. It turns every session into a lasting, monetisable, sponsor-branded asset, and in doing so, transforms how the world's knowledge is captured, consumed, and kept alive.

YOUR PRODUCT

Questions / Answers

Description of your technology

Every event loses knowledge the moment the session ends. Voxo is the platform built to make sure that never happens again.

At its core, Voxo captures live audio from every stage simultaneously, processing each session through a proprietary pipeline that combines transcription, AI content generation, quality assurance, and branded publishing, all within minutes of a session ending. What would take an in-house production team months to deliver, Voxo produces before the next speaker has even left the stage.

The Intelligence Layer

Voxo is LLM-agnostic by design, integrating with OpenAI, Google Gemini, Anthropic Claude, or client-mandated models such as Salesforce Einstein. The platform ingests raw audio, generates structured transcripts, and applies multiple layers of natural language processing to extract key takeaways, speaker quotes, thematic clusters, and editorial-quality summaries in a single automated flow.

The Product Suite

Every output is immediately branded in the event's visual identity and ready to publish. AI Session Summaries are delivered within minutes of each session concluding, available in desktop, mobile, and LinkedIn-optimised formats. AI Podcasts transform the same content into five-minute conversational audio recaps, with sponsor announcements woven seamlessly into the conversation. Daily and full Event Reports consolidate intelligence from every stage into executive-ready documents, complete with buzzword counters and deep-dive articles on trending topics. For multi-track events, Theme Reports give each content stream its own dedicated, sponsor-ready publication.

On-site, Voxo extends beyond the screen. Digital signage surfaces real-time highlights between talks, while Live AI Commenting summarises sessions minute by minute and streams those insights to venue screens or attendees' mobile devices, ensuring no one misses a key moment regardless of which room they are in. Each speaker also walks away with a polished AI summary of their own session, ready to share with their networks in one click.

Human-in-the-Loop Quality Assurance

What separates Voxo from raw AI output is its dedicated QA layer. Every piece of content is reviewed by a human team before publishing: company and product names verified, speaker titles confirmed, and speaker quotes audio-checked against original transcripts. The result is content that carries the editorial integrity of a professional publications team, produced at AI speed.

Integration, Reach, and ROI

Voxo is built to live inside existing event ecosystems rather than sit alongside them. The platform embeds directly into event apps via iFrame or unique session URLs, with native integrations spanning RainFocus, Swapcard, Cvent, Grip, ExpoPlatform, Swoogo, Amego, and more. Audio streaming piggybacks on existing AV infrastructure, making technical setup seamless.

All content lives in a fully branded Content Hub where every download is tracked and every share is measured. Organisers gain granular insight into which sessions resonated most, shaping future programming with real data. Voxo also opens entirely new commercial models through sponsor-branded summaries and micro-ticketing, transforming the post-event archive into an active revenue stream.

The result is an end-to-end AI content infrastructure that makes events immortal, sponsors measurable, and knowledge unstoppable.

TECHNOLOGY DESCRIPTION

Questions / Answers

Explain how the AI works in your solution?

Voxo's AI content platform operates through a collaborative partnership model where the AI supplier works closely with the event organiser throughout the entire event lifecycle. The technology itself is a real-time content generation system that processes live audio and produces multiple output products—summaries, podcasts, reports, and branded assets. What distinguishes the collaboration model is that the AI supplier is not a black-box vendor, but an active partner at every stage. Pre-event, Voxo's team works with the organiser on project planning, brand design, AV coordination, and marketing strategy. During the event, Voxo's team is there to monitor production, ensure quality, and adapt to changing conditions. Post-event, Voxo provides analytics and strategic guidance to help organisers understand what worked and plan for future events. The AI system itself piggybags on existing AV infrastructure rather than requiring deployment of new equipment. This reduces technical complexity and cost. The platform integrates natively with the organiser's event tech stackand the integration is seamless. Attendee data, session information, speaker details all flow automatically from the event system into the AI pipeline. The result is a partnership where the AI supplier functions almost as an extension of the organiser's team.

What specific problem does this AI solve?

Event organisers and the agencies that manage events have traditionally faced a difficult choice when considering AI-content services. Option one: deploy an AI vendor at the event, but treat them as a vendor. The vendor delivers their software, provides limited support, and the organiser is responsible for success. If something goes wrong, if the output quality is poor, if the integration with the event tech stack fails, the organiser is left to troubleshoot alone. Option two: don't use AI services at all, and accept that event content will be ephemeral. The traditional vendor-buyer relationship creates distance and misaligned incentives. The vendor's goal is to deploy the product. The organiser's goal is to create exceptional events with lasting impact. Voxo solves this problem by adopting a partnership model rather than a vendor-buyer model. The AI supplier becomes an extension of the organiser's team, sharing responsibility for success. Voxo's team works with the organiser from initial planning through post-event analysis. They understand the organiser's goals, constraints, and priorities. When something goes wrong, they troubleshoot together. When an opportunity emerges to create exceptional content, they collaborate to execute it. This partnership approach aligns incentives and ensures everyone is working toward the same goals.

What makes your approach different or innovative?

Voxo's collaborative partnership model is innovative in how it transforms the relationship between technology providers and event organisers. Historically, technology vendors have been arms-length relationships. You buy the software, the vendor supports it, and that's the extent of the partnership. Voxo inverts this model by making the relationship collaborative and ongoing. The partnership begins pre-event with project planning meetings where Voxo's team learns about the organiser's goals, audiences, speakers, and success metrics. Design and Marketing sessions ensure that generated content reflects the organiser's visual identity and messaging. This pre-event investment ensures that when the event runs, everything is optimized. During the event, Voxo's team monitors production in real-time. If a session is experiencing technical difficulties, they troubleshoot. If content quality is lower than expected, they investigate and improve. If new opportunities emerge—a session is resonating particularly strongly with attendees—they suggest ways to amplify that content. Post-event, Voxo provides detailed analytics showing which content performed best, which sessions resonated, which topics drove engagement. This data becomes the foundation for the organiser's strategy for future events. The innovation is that the AI supplier functions as a strategic partner, not just a technology vendor.

VALIDATION

Questions / Answers

How did you test, validate, or quality-check the AI outputs to ensure they were accurate, safe, or reliable?
Voxo's quality assurance process is comprehensive, combining automated screening with expert human review. Every generated summary undergoes validation against the original session recording for accuracy. Speaker names and titles are verified using official event directories and LinkedIn. Company and product names are checked for correct spelling and context. All direct quotations are audio-verified to ensure they are exact, in proper context, and accurately represent the speaker's position. Imagery and visual assets are reviewed for quality, accuracy, and brand compliance. The QA process scales across concurrent sessions through a tiered approach where automated systems catch obvious errors and human reviewers verify accuracy and quality standards.

IMPACT
In one summary, explain the overall impact of your AI solution. Please cover four areas: innovation, execution, user or customer outcomes, and measurable results.

Innovation
Voxo’s core innovation is not only technological, but relational. It redefines how AI suppliers and event organisers work together by replacing the traditional vendor-client dynamic with a fully integrated partnership model. Historically, AI and event technology providers have operated at arm’s length, delivering tools that organisers are expected to implement, manage, and troubleshoot independently. This creates misaligned incentives, where the supplier’s responsibility ends at deployment, while the organiser carries the burden of execution and outcome.
Voxo fundamentally changes this structure by embedding itself into the organiser’s workflow as an operational and strategic partner. Rather than delivering a standalone product, the platform is implemented as part of a collaborative system where both parties share responsibility for success. This means that planning, execution, and optimisation are conducted jointly, with continuous alignment on goals, priorities, and outcomes.
The innovation lies in how this partnership is operationalised. Pre-event, Voxo works directly with organiser teams to design content strategies, align branding, and coordinate technical infrastructure. During the event, the collaboration becomes real-time, with active monitoring, troubleshooting, and optimisation taking place as sessions unfold. Post-event, the partnership continues through analytics and strategic feedback loops, ensuring that learnings are carried forward into future events.
This approach transforms AI from a tool into a capability embedded within the organiser’s organisation. It reduces friction, eliminates gaps in responsibility, and ensures that the technology is fully aligned with the event’s objectives.
By aligning incentives and integrating execution, Voxo introduces a new standard for collaboration in event technology. The AI supplier is no longer a vendor delivering software, but a partner contributing directly to the success and impact of the event.

Questions / Answers

Execution

Voxo's execution model is built around continuous collaboration across the entire event lifecycle, ensuring that both the organiser and the AI supplier operate as a unified team rather than separate entities. This approach enables consistent delivery of high-quality outputs even in complex, high-pressure event environments.

Execution begins in the pre-event phase, where Voxo works closely with organiser teams to establish a shared foundation. This includes detailed project planning, where objectives, content strategy, and success metrics are aligned. Branding sessions ensure that all outputs reflect the organiser's identity, while technical coordination with AV teams ensures seamless audio capture across all stages. Integration with the organiser's existing tech stack allows data to flow automatically into the AI pipeline, reducing manual work and eliminating potential points of failure.

During the event, execution becomes highly dynamic and collaborative. Voxo's team remains actively involved, either on-site or on-call, monitoring production in real time. As sessions conclude, content is generated within minutes, but the collaboration does not stop at automation. If technical issues arise, both teams work together to resolve them immediately. If certain sessions generate exceptional engagement, Voxo can proactively suggest ways to amplify that content. This real-time collaboration ensures that opportunities are captured and challenges are addressed as they happen.

Post-event execution continues the partnership. Voxo provides detailed analytics and insights, enabling organisers to understand content performance and audience engagement. These insights are not delivered in isolation but are discussed collaboratively, forming the basis for future event improvements and strategic decisions.

What distinguishes this execution model is its consistency. Regardless of event size, format, or complexity, the same collaborative structure ensures that execution remains aligned, responsive, and outcome-driven.

Outcome

The outcomes of Voxo's collaboration model extend beyond improved content production to fundamentally reshape how organisers and technology partners work together. By aligning incentives and sharing responsibility, the platform creates a more efficient, responsive, and results-driven operating model.

For organisers, the primary outcome is reduced operational burden combined with increased confidence in delivery. Instead of managing a technology vendor and troubleshooting issues independently, organisers gain a partner that actively contributes to execution. This allows internal teams to focus on higher-value activities such as attendee experience, programming, and strategic planning, while still benefiting from advanced AI capabilities.

The collaboration model also leads to higher quality outputs. Because Voxo is directly involved in both planning and execution, the generated content is better aligned with the organiser's goals, brand, and audience expectations. Continuous feedback loops during the event ensure that quality is maintained and improved in real time, rather than relying on post-event corrections.

For both parties, the outcome is stronger alignment and accountability. Success is no longer defined by whether the technology functions, but by whether the event delivers meaningful results. This shared ownership creates a more proactive and solution-oriented working relationship.

Attendees benefit indirectly from this model through more consistent and accessible content, while speakers gain greater visibility through high-quality outputs. However, the most significant outcome is at the organisational level, where collaboration replaces fragmentation.

At an industry level, Voxo's approach sets a new expectation for how AI suppliers should engage with organisers. It demonstrates that the most effective use of AI is not as a standalone tool, but as a capability embedded within a collaborative partnership.

Questions / Answers

Results

Voxo’s results demonstrate that its collaboration model is not only conceptually strong but also proven in real-world applications across a diverse range of events. The platform has been deployed across multiple large-scale and complex events, consistently delivering high-quality outputs through close coordination between Voxo and organiser teams.

Across its portfolio, Voxo has generated over 100,000 content downloads, reflecting strong audience engagement and validating the effectiveness of the collaborative execution model. At AI Summit London, the partnership supported 176 sessions across 7 stages, delivering over 21,000 downloads and 17,000 unique views. This level of output and engagement would not have been possible without tight coordination between Voxo and the organiser’s teams across content, AV, and platform integration.

Similarly, AI Summit New York delivered over 25,000 downloads across 205 sessions, demonstrating the ability to replicate this collaborative model across geographies and event formats. At Genesys Xperience, one of the most complex deployments with 15 concurrent stages, Voxo and the organiser successfully managed real-time content production, resulting in over 10,300 downloads. This highlights the robustness of the partnership model even under high operational pressure.

Other events such as TechArena 2025, RainFocus Insight, and EMS 2025 further demonstrate consistency across different scales, industries, and audience sizes. In each case, the collaboration between organiser and AI supplier enabled efficient execution, high-quality outputs, and strong engagement.

Qualitative feedback reinforces these results. Event professionals have highlighted not only the quality of the content but also the value of having a proactive and engaged partner throughout the process. The perception of Voxo as “part of the team” rather than an external vendor is a recurring theme in customer feedback.

Together, these results provide clear evidence that Voxo’s collaboration model delivers measurable improvements in execution, output quality, and overall event impact, establishing a new benchmark for partnerships between organisers and AI suppliers.

CASE STUDY

Describe how the AI was used in practice.

Voxo's platform is deployed across the full portfolio using the same core technical architecture customized for each event's needs. Pre-event coordination with organiser teams ensures audio capture integration, branded template creation, and content strategy alignment. During events, as sessions conclude, audio is captured and routed to Voxo's processing pipeline. Within minutes, the platform generates written summaries, conversational podcasts, and contributes to daily and theme reports. All content is automatically branded based on pre-configured specifications and undergoes human QA review. Approved content is published to attendee platforms. The platform scales from small events with dozens of sessions to major conferences with 200+ concurrent sessions across multiple stages. At online events, the platform operates in virtual environments. Across all deployments, the core workflow remains consistent: capture audio, transcribe, generate content with AI, QA, and publish.

Questions / Answers

What measurable results or improvements did it deliver?
(Include any evidence that shows real-world impact.)

Voxo's results across the portfolio prove effectiveness and scalability. Combined AI Summit London and New York results: 381 sessions, approximately 10,000 attendees, 46,000+ downloads demonstrating enterprise-level event complexity handling. At Genesys Xperience with 15 stages simultaneously (highest complexity), the platform generated 10,300 downloads proving extreme concurrency capability. At TechArena 2025, 15,000+ downloads across a different industry vertical demonstrates broad applicability. Customer feedback confirms results: Caroline Hicks noted "17,000 unique views is just staggering, proving how valuable both our content and this service were." Steve Johnson noted summaries were shared widely and Voxo is "one of the only tools built specifically for live programming." Richard Belcher commented on impressive accuracy. Jay Schwedelson offered "Every event needs Voxo!!" These quotes from leading industry professionals represent genuine recognition that Voxo has created a solution transforming events.

MODEL TRANSPARENCY (optional)

What type of AI model or technique does your solution use? Please provide a simple, high-level explanation that helps judges understand the approach (no confidential or proprietary details required).
Voxo's platform is built on model-agnostic architecture supporting multiple large language model providers. Customers choose OpenAI, Google Gemini, Anthropic Claude, or Salesforce Einstein based on preferences, cost, and requirements. This flexibility ensures customers control infrastructure and avoid vendor lock-in. The technical pipeline begins with audio capture from existing AV infrastructure. Automatic speech recognition converts session audio into detailed text transcripts with speaker identification. These transcripts feed into the chosen large language model with customized prompts designed for each content type. For summaries, prompts extract key points and preserve quotations. For podcasts, prompts generate conversational scripts. For reports, prompts aggregate sessions and identify insights. All prompts avoid hallucination and maintain accuracy with safeguards against bias. Generated content undergoes human-in-the-loop QA with automated systems screening errors and human reviewers verifying accuracy. The complete audit trail of all generation and QA decisions maintains compliance and transparency, allowing customers to see exactly how the AI system is performing and what quality measures are in place.

Criteria	Score
Innovation * How original and forward-thinking is the approach? Whether you built an AI solution, adopted AI within your own events operation, or are bringing an early-stage concept to market, judges want to see genuine originality. Has AI been applied in a new or distinctive way? Does it solve a real problem creatively rather than following the obvious path? Look beyond off-the-shelf deployment and assess the quality of thinking behind the approach.	/ 100
Impact * What difference has this made, or what difference is it credibly expected to make? For live solutions, look for concrete evidence -- engagement rates, time saved, revenue generated, cost reduction, satisfaction scores. For pilot or beta-stage entries, early indicators such as user testing results, pilot outcomes, letters of intent, or projected impact grounded in credible data are all valid. Strong entries will be specific, not vague.	/ 100

Recuse yourself if you have a professional or personal conflict of interest

Scoring is incomplete ⚠

Criteria	Score
Execution * How well has this been implemented or developed? For suppliers and vendors, consider the quality of the build, the robustness of delivery, and how challenges were handled. For organisers, consider how well AI was embedded into operations and how the team managed change. For early-stage entries, assess the quality of the product so far, the clarity of the roadmap, and the credibility of the team's approach. Thoughtful, professional execution at any stage counts highly.	/ 100
Results * What has been achieved, and what does the evidence show? For established solutions, consider client outcomes, retention, testimonials, and industry recognition alongside hard metrics. For organisers, attendee feedback, operational improvements, and stakeholder satisfaction all count. For startups or beta entries, judges should look for credible progress -- pilot conversions, early user feedback, investment secured, or strategic partnerships -- and should assess potential alongside proven outcomes. Do not penalise entries for being early stage; reward evidence of meaningful progress and a clear path to impact.	/ 100
