eBrain Technology Group GmbH

Product Name (optional)
eBrain

Questions / Answers

Company profile

eBrain Technology Group builds a unique AI-centric operating model for event operations and live communication, with a core focus on attendee management.

The company unites what rarely comes together in this industry: over two decades of international event excellence, deep AI and strategy expertise, and a dedicated full-stack and AI engineering team.

The foundation was an attendee management system successfully deployed since 2004, operationally validated across industries and event formats. Rather than cosmetically updating this system, the team chose a radical rebuild: the entire operational value chain — from website creation through registration, communication and live operations to analytics - was reconceived as an AI-centric, synchronized workflow architecture.

eBrain operates on EU-sovereign cloud infrastructure (IONOS), is GDPR-compliant by design and addresses the requirements of the EU AI Act.

The team comprises event industry veterans with decades of international live communication delivery, AI strategists, academically grounded specialists, and experienced developers.

Headquartered in Berlin, eBrain serves event agencies and enterprises that want to move beyond digitizing attendee management toward intelligently orchestrating it - with the goal of radically reducing operational burden and returning focus to creativity, guest quality, and strategic impact.

YOUR PRODUCT

Questions / Answers

Description of your technology

eBrain is not an event tool with AI features. eBrain is an AI-centric operating model that redefines the entire operational logic of attendee management.
The event industry has digitized its processes - but it has not made them intelligent. Behind every successful event lies an invisible layer of fragmented systems, spreadsheet workarounds, manual change cascades, and time-consuming coordination. Event teams spend the majority of their working hours not on creative work and guest experience, but on administration. eBrain was built to solve this structural problem.

Five-layer architecture:
eBrain organizes event operations across five interconnected layers:
The Experience Layer encompasses event websites, registration, ticketing, forms, and check-in - everything participants and teams interact with directly. The Operations Layer manages attendees, contingents, hotel and transfer logic, communication, surveys, tasks, and change management. The Intelligence Layer embeds AI into every operational step: website automation, AI-assisted communication, reporting, NLP insights, forecasting, recommendations and Emily as the dialogic access and action layer - powered by an agentic architecture where the LLM reasons, selects tools, and chains actions autonomously. The Synchronization Layer serves as the single source of truth, keeping changes, statuses, and data consistent across all touchpoints - eliminating manual reconciliation cascades. The Trust & Compliance Layer ensures EU-sovereign hosting, GDPR compliance, and EU AI Act readiness.

Four core engines across the full event lifecycle:
The Setup Machine enables event creation, AI-powered website building via wizard and prompting, registration configuration, and campaign launch. The Run Machine delivers a live dashboard with task management, real-time contingent management for hotels, sessions, shuttles, and catering, automated communication, and synchronized change management. The Onsite Machine handles badges, QR-based check-in, and live attendance status. The Learn Machine generates day-to-day reporting, KPI analytics, forecasting, NLP feedback insights, and historical benchmarks.

Emily - the new interaction logic:
Emily is not a chatbot feature. Emily is a dialogic access, guidance, and action layer. Event managers ask natural-language questions ("How many vegetarians are registered?", "Which hotels are overbooked?"), receive immediate operational answers with action recommendations, and can trigger actions directly - such as sending a personalized VIP reminder in German and English. Emily makes even less experienced team members immediately effective and dramatically reduces onboarding time.

The result is not a better tool. It is a new operating model: fewer tool switches, less manual coordination, fewer errors - and fundamentally more time for what event teams are actually here for: staging, guest quality, and strategic impact.

TECHNOLOGY DESCRIPTION

Questions / Answers

Explain how the AI works in your solution?

AI operates in eBrain across three clearly differentiated levels - not as a single feature, but as a continuous intelligence layer spanning the entire event operations value chain.

LLM level: High-performance language models generate event website content, optimize copy, translate across languages, process natural-language queries, and deliver contextual assistance. A corporate design crawler automatically extracts brand identity from existing web presences.

Assistant level: Specialized AI assistants guide users through every phase of attendee management — website building, communication creation, reporting, and operational questions. They deliver not just information, but contextual guidance and action recommendations adapted to the current event status and user role.

Agent level: Task-oriented AI agents support or trigger concrete operational steps — the CTA agent suggests daily prioritized to-dos, while other agents handle email creation, data reconciliation, and cross-touchpoint status updates.

Emily unifies all three levels as the dialogic interface: users interact with the entire system through natural language, receiving answers, recommendations, and triggering actions — without context switches. The entire AI infrastructure runs on EU-sovereign cloud (IONOS), is GDPR-compliant by design, and addresses EU AI Act documentation and risk assessment requirements.

What specific problem does this AI solve?

The event industry does not have a creativity problem. It has an operational burden problem.

Existing attendee management tools have digitized legacy processes - but they have not made them intelligent. They replicate the same unintelligent workflows on a digital surface: fragmented data, manual change cascades, disconnected communication, spreadsheet reconciliation. The result is legacy thinking running on modern infrastructure — consuming capacity without generating value.

A single participant change - a cancellation, a room switch, a dietary update - triggers manual follow-up across five or more touchpoints: update the list, notify the hotel, adjust the shuttle plan, correct the badge, revise the catering count, adapt the communication. These cascades cost time, produce errors, and trap highly qualified teams in administrative labor instead of creative and strategic work.

Registration websites take days instead of minutes. Contingents and hotels are nearly impossible to steer in real time. Reporting happens after the event instead of during operations. Onboarding new team members takes too long because system logic is complex and never self-explanatory.

eBrain solves this structural problem by rebuilding the entire operational logic as AI-centric — synchronized, dialogic, action-oriented. The system relieves, guides, and orchestrates.

Questions / Answers

What makes your approach different or innovative?
The fundamental difference: eBrain did not bolt AI onto an existing system. eBrain rebuilt the operating model itself as AI-centric from the ground up.

First: Systemic AI, not point solutions. While others add isolated AI features - a chatbot here, text generation there - eBrain embeds AI across the entire process cycle: from event creation through registration, communication, live operations, and onsite to post-event learning. Every operational step becomes more intelligent, not just one.

Second: Dialogic orchestration replaces static software interaction. Emily transforms how people interact with event operations. Instead of navigating menus and forms, teams interact through natural language - receiving not just answers, but guidance, prioritization, and action triggers.

Third: Synchronized truth replaces fragmented data. The Synchronization Layer eliminates the core problem of manual change cascades across hotels, shuttles, catering, badges, and communications. One change takes effect system-wide - instantly, consistently, without manual follow-up.

Fourth: Proven process foundation, not startup speculation. eBrain builds on 20+ years of real event process logic - validated in international projects. This is an AI-centric rebuild of a battle-tested operational engine.

The innovation is not a feature. It is the paradigm shift: from event administration to event intelligence.

VALIDATION

Questions / Answers

How did you test, validate, or quality-check the AI outputs to ensure they were accurate, safe, or reliable?
eBrain's validation strategy follows one principle: practical intelligence before lab perfection. Every AI application is measured against real operational impact, not technological ambition.

1. Foundation from 20+ years of operational validation
The underlying attendee management logic is not theoretical - it has been tested in real event projects across industries and complexity levels for over two decades. This operational experience defines where AI creates genuine leverage and where human control remains essential. eBrain was not built from technology enthusiasm, but from deep understanding of real event bottlenecks.

2. Surgical AI integration by use case
Rather than deploying AI generically, the most critical operational bottlenecks were analyzed individually: website building, list reconciliation, change management, communication, task orchestration, reporting, onsite processes. For each use case, the team defined which AI intervention serves a clear business purpose and which quality parameters apply.

3. Three-level quality assurance
At the LLM level, generated content - website copy, communications, translations - is constrained by contextual parameters and brand logic. At the assistant level, recommendations and guidance are bound to actual event data - assistants work on real participant, contingent, and status data. At the agent level, triggered actions are presented as suggestions - final decisions and approval remain with the human operator. This reflects eBrain’s commitment to responsible AI: technology that augments human judgment, maintains full operator control, and operates within clear ethical and regulatory boundaries.

4. Technical safety and security layer
The report generation engine includes a dedicated SQL verification system: every AI-generated query is validated against table and column whitelists, blocked from executing DELETE, DROP, INSERT, or UPDATE operations, prevented from exposing internal record identifiers, and automatically scoped to the relevant event data - ensuring strict data isolation between clients. This verification layer is covered by 16 automated test cases. Tool execution follows a whitelisting protocol: read-only operations auto-execute, while state-changing actions require explicit human confirmation.

5. Synchronization Layer as consistency guarantee
The Synchronization Layer simultaneously functions as a validation layer: changes are not processed in isolation but reconciled system-wide. Inconsistencies between touchpoints are detected and resolved before they produce operational errors.

6. EU-sovereign infrastructure as trust foundation
The entire platform runs on IONOS EU cloud with GDPR-compliant data processing. The architecture addresses EU AI Act requirements regarding risk assessment and documentation capability. Data sovereignty, traceability, and governance are architecturally embedded - not as a retrospective compliance exercise, but as an integral part of system design.

7. Internal benchmarks and iterative optimization
KPI measurements for administration reduction, process costs, and participant satisfaction are collected on a project-specific basis and feed into continuous improvement of AI models, assistants, and agents. The Learn Machine closes the feedback loop: insights from every event improve quality for the next.

Questions / Answers

IMPACT
In one summary, explain the overall impact of your AI solution. Please cover four areas: innovation, execution, user or customer outcomes, and measurable results.

Innovation
eBrain's innovation does not lie in a single AI feature. It lies in a paradigm shift: from software-centric event administration to AI-centric event intelligence.

The event industry has digitized extensively - but it has not changed its fundamental operational logic. Event teams still work reactively, in fragments, driven by administration. Systems manage data, but they do not think ahead. They do not synchronize. They do not guide. They do not recommend. They do not learn.

eBrain breaks with this logic fundamentally.
Paradigm shift in the operating model: While conventional event platforms force people to adapt to software, eBrain reverses the logic: the system adapts to the people, actively supports them, and intelligently orchestrates processes. This is not a UX update. It is a new category: AI-centric event operations.

AI as a continuous intelligence layer: eBrain does not deploy AI at isolated touchpoints but across the entire attendee management value chain - from event initialization through website generation, registration, communication, live operations, and onsite management to post-event learning. This end-to-end AI penetration is currently unique in the market.

Emily as a new interaction paradigm: Emily is not a chatbot add-on. Emily represents a fundamental shift in human-system interaction for event operations. Teams interact dialogically with the entire operating system: they ask, they receive contextual answers, they get action recommendations, they trigger executions — without context switches, without media breaks. Even less experienced team members become immediately effective through Emily. This reduces onboarding time, prevents errors, and dramatically increases the scalability of event teams.

Synchronized truth instead of data chaos: The Synchronization Layer solves a problem the entire industry has accepted for years: that a single participant change triggers manual follow-up across hotels, shuttles, catering, badges, session allocations, and communications. In eBrain, every change takes effect system-wide, instantly, and consistently.

Learning as a system property: Through the Learn Machine, events are no longer treated as isolated projects but as data points within an operational learning cycle. NLP insights from free-text feedback, historical benchmarks, and forecasting make each subsequent event better. The industry moves from retrospective reporting to predictive steering.

Why this is genuine innovation - not just a feature upgrade: Most AI applications in the event industry add a single function to an existing system - a text generator, a chatbot, an analytics dashboard. eBrain, by contrast, rebuilt the entire operational logic as AI-centric from the ground up. The innovation is not in a module. It is in the architecture, the synchronization principle, the dialogic interaction, and the end-to-end orchestration across the full event lifecycle. That is the difference between "software with AI" and "an AI-centric operating model."

Questions / Answers

Execution
eBrain is not a concept paper. It is a working system, built by a team that unites event reality, AI depth, and engineering excellence.

Origin determines execution quality: eBrain could only emerge because three competencies converged that rarely exist within one team: decades of international event delivery experience, deep AI and strategy expertise, and a dedicated full-stack and AI engineering team that translates the target architecture into production-grade software.

Four phases of a disciplined rebuild:

In Phase 1 - Exposing the process architecture - the real value chain of event-based attendee management was mapped: initialization, invitation, communication, registration, management, contingents, onsite, reporting, and KPI analytics. Not as a feature inventory, but as a map of operational friction and AI leverage points.

In Phase 2 - Surgical use case identification — the most critical bottlenecks were examined individually: website building, list reconciliation, change management, communication, task orchestration, reporting, onsite processes. Every AI intervention serves a clear business and operational purpose.

In Phase 3 - Defining the AI-centric target model — the Setup/Run/Learn model emerged: planning, live operations, and insights are no longer treated as separate software domains but as a connected, intelligent operations system.

In Phase 4 - Rebuilding the core engines — the four functional machines were reconstructed: Setup Machine, Run Machine, Onsite Machine, and Learn Machine -connected through the Intelligence Layer with Emily, assistants, and agents.

What is productively deployed today:
The platform covers the full-circle process: event creation and AI-powered website building via wizard and prompting with corporate design crawler. Registration with shopping cart, add-ons, group logic, and flexible ticketing. A Communication Center with AI-assisted, hyperpersonalized communication in multiple languages. Attendee and contingent management with real-time control of hotels, sessions, shuttles, and catering - automatically synchronized when changes occur. A cockpit dashboard with essential tasks and AI recommendations. Badge creation with QR codes and an onsite check-in system with live status updates. Day-to-day reporting, smart analytics with forecasting, NLP feedback insights, and historical comparisons. And Emily as the AI buddy for queries, action recommendations, and execution triggers directly within the workflow.

EU-sovereign infrastructure: The entire platform operates on IONOS EU cloud, is GDPR-compliant by design, and addresses EU AI Act requirements. Data sovereignty is not a feature - it is an architectural principle.

The result of this execution: An enterprise-grade system that did not emerge from speculative startup logic, but from the disciplined re-architecture of an operationally proven attendee management foundation - built by people who know how events actually work under pressure - delivering operational excellence at portfolio scale.

Questions / Answers

Outcome

eBrain changes what event teams do with their time, their energy, and their resources.
The central outcome is not a more efficient process. It is a shift in where work happens: away from operational heavy lifting, toward creation, guest quality, and strategic impact.

For event agencies:
Agencies reclaim margin with eBrain. Administrative effort per project drops substantially. Event websites that previously required 6–8 hours of manual work are created through AI-powered website building in minutes. Communication is no longer laboriously coordinated across scattered channels - it is AI-assisted, personalized, and sent directly from the system. Change management - previously a source of constant manual follow-up across hotels, shuttles, catering, and badges - runs synchronized and system-wide.
The economic result: agencies can deliver more events with the same team size at higher quality. Scaling without proportional headcount growth becomes possible. Senior capacity is freed from operational routine and available for consulting, concept development, and client leadership. Junior roles become productive from day one through Emily and guided workflows - reducing onboarding costs and increasing organizational resilience.

For enterprises with their own event needs:
Enterprises gain governance, transparency, and control at a new level. The single source of truth eliminates data discrepancies between teams, service providers, and stakeholders. Real-time reporting replaces retrospective analysis. Decisions become more data-driven and faster.
The operational result: fewer internal coordination loops, lower process costs, less escalation risk. The strategic result: stronger brand experience through personalized communication, seamless onsite processes, and more professional attendee experiences.

For event managers in daily operations:
One system instead of tool chaos. More certainty instead of constant doubt about data accuracy. Less stress before the event because changes no longer need to be manually cascaded across five or six touchpoints. Emily as an always-available AI buddy that answers operational questions instantly, suggests prioritized to-dos, and supports routine tasks.

The overarching outcome:
eBrain returns to the event industry what administrative burden has consumed for years: time for what defines great events: dramaturgy, creative excellence, and strategic client leadership. The platform proves that the solution to the operational burden problem does not lie in more headcount, but in a fundamentally more intelligent operating logic.

Questions / Answers

Results

The measurable results confirm: eBrain delivers structural operational leverage, not incremental improvement. Headline result: across a portfolio of 115+ annual events in attendee management, eBrain's operational leverage translates to an estimated saving of over 12,000 staff hours and €650,000+ in process costs per year. Validated across 100+ scenarios using real parameters from 20+ years of predecessor operations.

Core metrics - before and after:

Website and setup: Event registration websites that previously required 6–8 hours of manual CMS work are now generated in minutes through AI-powered website building with automatic corporate design extraction.

Administration: On the predecessor system, a typical event consumed approximately 160 staff hours in administration - registration management, change cascades, communication coordination, and logistics. AI-assisted workflows across the full event journey demonstrate a reduction of up to 70%, freeing over 100 hours per event for creative and strategic work.

Process costs: At industry-standard rates of €35–40 per hour, 160 hours of administration translate to €5,600–6,400 in process costs per event. eBrain's synchronized workflows and AI automation demonstrate up to 50% savings in attendee management process costs - compounding across every event delivered.

Change management: A single participant change previously triggered manual follow-up across 5–6 touchpoints: participant lists, hotel contingents, shuttle plans, catering counts, badges, and communications. The Synchronization Layer eliminates these cascades entirely. Every change takes effect system-wide, instantly, and consistently.

Onboarding: New team members previously required 6–7 days to become operational on the predecessor system. Through Emily and guided workflows, junior staff become productive from day one — a reduction in onboarding time of over 80%.

Attendee satisfaction: Events on the predecessor system achieved satisfaction scores ranging from 5–8 out of 10 - a wide variance driven by manual, fragmented workflows. eBrain delivers higher and more consistent satisfaction through intuitive registration UX, personalized communication by participant type, and sub-30-second QR check-in - replacing the friction points that drove predecessor scores as low as 5 out of 10.

Output leverage: Event teams deliver more events at higher quality with the same or fewer resources. Delivery capacity grows without proportional headcount increases.

Qualitative results with strategic relevance:

Faster time-to-live: events go online faster — a direct competitive advantage in time-critical situations.

Higher decision velocity: day-to-day reporting, real-time analytics, and Emily queries deliver operational transparency during live operations - not after the event is over.

Better data quality and consistency: the Synchronization Layer eliminates error-prone manual data maintenance across multiple touchpoints. Participant, status, and communication data are reliable and current at all times.

Stronger governance: EU-sovereign infrastructure, GDPR compliance, and AI Act readiness create a trust foundation

Questions / Answers

that is particularly decisive in corporate, enterprise, and public sector environments.

What these numbers mean - beyond the metrics: The real impact is not in percentages. It is in the fact that event teams can once again do what they entered this industry to do: create experiences, delight guests, lead clients strategically - instead of reconciling spreadsheets, chasing manual updates, and operating systems that work against them rather than for them.

CASE STUDY

Questions / Answers

Describe how the AI was used in practice.
The following scenario illustrates eBrain's operational impact, modelled on real event parameters from 115+ annual events managed on the predecessor platform.

Practice scenario: International corporate conference with 800+ attendees, multiple participant types, and complex logistics.

An event team - consisting of one experienced project lead and two junior staff members - sets up a multi-day international conference using eBrain. The event involves VIPs, speakers, sponsors, regular attendees, and staff, each with different permissions, hotel contingents, session assignments, shuttle needs, catering preferences, and communication requirements.

Phase 1 - Setup (minutes instead of days):
The project lead creates the event with a name and a prompt. The AI website builder generates a complete event website in the client's corporate design - the CD crawler automatically extracts colors and logo structure from the existing web presence. Subpages, registration forms, and content are created via prompting. What previously required 6–8 hours of manual CMS work is live within minutes. Registration is configured: customizable forms, shopping cart with hotel selection, session booking, transfer options, and social program. Ticketing with VIP and early-bird logic is activated.

Phase 2 - Communication and invitation:
Through the Communication Center, AI generates invitation texts - personalized by participant type, in German and English. The project lead reviews, adjusts, and sends directly from the system. Reminders and follow-ups are configured as automated campaigns. The junior team member asks Emily: "Write a VIP reminder in English referencing the evening program." Emily generates the text; the team member reviews and approves.

Phase 3 - Live operations and change management:
During the registration phase, participants cancel, rebook, change room types, update dietary requirements. In conventional systems, each change triggers manual cascades across 5–6 touchpoints. In eBrain, every change takes effect synchronously: the contingent manager updates room availability automatically, shuttle planning adjusts, catering counts recalculate, session capacities rebalance, communication adapts, participant status is instantly correct everywhere. Emily answers spontaneous questions: "How many vegetarians are registered?" - instant answer from real-time data.

Phase 4 - Onsite:
Branded badges with QR codes are generated directly from registration data. On event day, attendees scan their QR code at check-in. Attendance status updates live in the system without manual lists.

Phase 5 - Learn:
Post-event, the Learn Machine delivers automated reports: attendee KPIs, no-show analysis, NLP-processed free-text feedback with pattern and sentiment recognition. Historical comparisons with previous events reveal improvement opportunities feeding directly into planning the next event.
The decisive point: Two junior team members were fully operational from day one through Emily and guided workflows - without the 6–7 days of onboarding the predecessor system required.

Questions / Answers

What measurable results or improvements did it deliver?
(Include any evidence that shows real-world impact.)

The measurable improvements manifest across the entire event value chain - validated against real operational parameters from 115+ annual events managed over 20+ years on the predecessor system.

Website building and setup: AI-powered event website creation reduces build effort from 6–8 hours to minutes - a reduction of over 90%. Via wizard and prompting, a complete, brand-compliant event web presence is generated including subpages, registration forms, and content. The corporate design crawler adopts visual identity automatically.

Communication: AI-assisted, hyperpersonalized communication by participant type (VIP, speaker, sponsor, staff) replaces manual text creation and scattered email threads. Texts are generated, optimized, and translated into multiple languages - directly in the system, in brand voice, traceable and measurable.

Change management: Every participant change takes effect system-wide and instantly via the Synchronization Layer. Previously, a single change triggered manual follow-up across 5–6 touchpoints. eBrain eliminates these manual cascades entirely.

Administration and process costs: Events on the predecessor system consumed approximately 160 staff hours in administration at rates of €35–40 per hour - translating to €5,600–6,400 in process costs per event. eBrain's AI-assisted workflows demonstrate up to 70% less administration and up to 50% savings in process costs, compounding across every event delivered.

Onboarding and team productivity: The predecessor system required 6–7 days to onboard new team members. Emily and guided workflows make even less experienced staff immediately effective — reducing onboarding time by over 80%.

Aggregated impact metrics (based on operational baselines from the predecessor system):

- Up to 70% less administration across the entire event journey
- Up to 50% savings in attendee management process costs
- Over 90% reduction in event website setup time
- Over 80% reduction in team onboarding time
- Elimination of manual change cascades across 5–6 previously disconnected touchpoints
- Higher data quality and consistency through synchronized data management

What these numbers mean — beyond the metrics: The real impact is not in percentage points. It is in the fact that event teams can once again do what they entered this industry to do: create experiences, delight guests, lead clients strategically - instead of drowning in coordination overhead and operating systems that work against them rather than for them.

MODEL TRANSPARENCY (optional)

Questions / Answers

What type of AI model or technique does your solution use? Please provide a simple, high-level explanation that helps judges understand the approach (no confidential or proprietary details required).
eBrain employs a multi-layer AI architecture connecting three technology levels - each optimized for different operational requirements in attendee management.

Foundation models and provider architecture:
The primary LLM is GPT-4.1, accessed via Azure OpenAI, delivering high-performance reasoning for content generation, natural-language query processing, and agentic tool orchestration. For resilience and EU data sovereignty, an automatic fallback routes to Meta Llama 3.3-70B-Instruct hosted on IONOS EU cloud - ensuring uninterrupted operation even when primary provider content filters trigger on edge-case inputs. Image generation uses Black Forest Labs FLUX.1-schnell, also hosted on IONOS, for AI-powered event visuals and email headers. This dual-provider architecture guarantees both performance and EU-sovereign data processing.

Agentic architecture with function calling:
Emily operates through an agentic loop - the LLM reasons about user intent, selects from tool functions across both the Python AI layer and the Ruby backend, executes them, evaluates results, and chains further actions - up to ten iterations per interaction. Safe operations auto-execute via whitelisting; state-changing actions require explicit user confirmation.

Specialized AI assistants:
Along every phase of the event lifecycle - Setup, Run, Onsite, Learn - contextually embedded assistants operate. These are configured for specific operational tasks: website building assistance, communication creation, reporting interpretation, operational questions. They deliver contextual guidance adapted to the current data situation, event status, and user role.

Task-oriented AI agents:
Agents take over or support concrete operational steps. The CTA agent suggests daily prioritized to-dos based on current event status. Additional agents support email creation, data reconciliation, status updates, and action recommendations. Agents operate in a suggestive mode — final decisions remain with the human operator.

NLP for feedback analysis:
Natural Language Processing is deployed in the Learn Machine to analyze free-text feedback from surveys and participant comments - pattern recognition, sentiment analysis, and automated summaries enable insights that would take days manually.

Emily as the integrating dialog layer:
Emily is the user-facing interface connecting all three AI levels. She processes natural-language queries, routes them to the appropriate subsystem - LLM, assistant, or agent - and delivers answers, recommendations, or action suggestions in a unified dialogic interaction.

Technical stack and infrastructure:
Python FastAPI microservices for AI processing, Rails 8 backend for data persistence and tool execution, Nuxt 3 and Vue frontend, PostgreSQL for operational and AI session data. YAML-based prompt engineering with versioned templates ensures reproducible AI behavior. The entire architecture runs on EU-sovereign cloud infrastructure (IONOS), is GDPR-compliant, and addresses EU AI Act documentation requirements.

Criteria	Score
Innovation * How original and forward-thinking is the approach? Whether you built an AI solution, adopted AI within your own events operation, or are bringing an early-stage concept to market, judges want to see genuine originality. Has AI been applied in a new or distinctive way? Does it solve a real problem creatively rather than following the obvious path? Look beyond off-the-shelf deployment and assess the quality of thinking behind the approach.	/ 100
Impact * What difference has this made, or what difference is it credibly expected to make? For live solutions, look for concrete evidence -- engagement rates, time saved, revenue generated, cost reduction, satisfaction scores. For pilot or beta-stage entries, early indicators such as user testing results, pilot outcomes, letters of intent, or projected impact grounded in credible data are all valid. Strong entries will be specific, not vague.	/ 100

Recuse yourself if you have a professional or personal conflict of interest

Scoring is incomplete ⚠

Criteria	Score
Execution * How well has this been implemented or developed? For suppliers and vendors, consider the quality of the build, the robustness of delivery, and how challenges were handled. For organisers, consider how well AI was embedded into operations and how the team managed change. For early-stage entries, assess the quality of the product so far, the clarity of the roadmap, and the credibility of the team's approach. Thoughtful, professional execution at any stage counts highly.	/ 100
Results * What has been achieved, and what does the evidence show? For established solutions, consider client outcomes, retention, testimonials, and industry recognition alongside hard metrics. For organisers, attendee feedback, operational improvements, and stakeholder satisfaction all count. For startups or beta entries, judges should look for credible progress -- pilot conversions, early user feedback, investment secured, or strategic partnerships -- and should assess potential alongside proven outcomes. Do not penalise entries for being early stage; reward evidence of meaningful progress and a clear path to impact.	/ 100
